Package 'kim'

February 27, 2024

Title A Toolkit for Behavioral Scientists

Version 0.5.422

Description A collection of functions for analyzing data typically collected or used by behavioral scientists. Examples of the functions include a function that compares groups in a factorial experimental design, a function that conducts two-way analysis of variance (ANOVA), and a function that cleans a data set generated by Qualtrics surveys. Some of the functions will require installing additional package(s). Such packages and other references are cited within the section describing the relevant functions. Many functions in this package rely heavily on these two popular R packages:

Dowle et al. (2021) https://CRAN.R-project.org/package=ggplot2>. Wickham et al. (2021) https://CRAN.R-project.org/package=ggplot2>.

akaike_weights 5

akaike_weights

Akaike Weights

Description

Compare adequacy of different models by calculating their Akaike weights and the associated evidence ratio.

Usage

```
akaike_weights(aic_values = NULL, print_output_explanation = TRUE)
```

Arguments

```
aic_values a vector of AIC values

print_output_explanation
    logical. Should an explanation about how to read the output be printed? (default = TRUE).
```

Details

Please refer to Wagenmakers & Farrell (2004), doi:10.3758/BF03206482

Value

the output will be a data.table showing AIC weights, their evidence ratio(s), etc.

Examples

```
\# default reference AIC value is the minimum AIC value, e.g., 202 below. akaike_weights(c(204, 202, 206, 206, 214))
```

```
assign\_fn\_parameters\_as\_vars
```

Assign function parameters as values

Description

Take a function and assign all the parameters defined within it as values in the specified environment (e.g., global environment)

Usage

```
assign_fn_parameters_as_vars(fun = NULL, envir = NULL)
```

6 barplot_for_counts

Arguments

fun a function

envir an environment in which to assign the parameters as values (default = .GlobalEnv)

Details

This function can be useful when you are testing a function and you need to set all the function's parameters in a single operation.

Examples

```
## Not run:
assign_fn_parameters_as_vars(pm)
assign_fn_parameters_as_vars(mean)
assign_fn_parameters_as_vars(sum)
assign_fn_parameters_as_vars(lm)
assign_fn_parameters_as_vars(floodlight_2_by_continuous)
## End(Not run)
```

barplot_for_counts

Barplot for counts

Description

Barplot for counts

Usage

```
barplot_for_counts(data = NULL, x, y)
```

Arguments

```
data a data object (a data frame or a data.table)

x name of the variable that will be on the x axis of the barplot

y name of the variable that will be on the y axis of the barplot
```

```
barplot_for_counts(x = 1:3, y = 7:9)
barplot_for_counts(data = data.frame(
    cyl = names(table(mtcars$cyl)),    count = as.vector(table(mtcars$cyl))),
    x = "cyl", y = "count")
```

binomial_test 7

binomial_test

Binomial test

Description

Conduct a binomial test. In other words, test whether an observed proportion of "successes" (e.g., proportion of heads in a series of coin tosses) is greater than the expected proportion (e.g., 0.5). This function uses the 'binom.test' function from the 'stats' package.

Usage

```
binomial_test(
  x = NULL,
  success = NULL,
  failure = NULL,
  p = 0.5,
  alternative = "two.sided",
  ci = 0.95,
  round_percentages = 0
)
```

Arguments

X	a vector of values, each of which represents an instance of either a "success" or "failure" (e.g., c("s", "f", "s", "s", "f", "s"))
success	which value(s) indicate "successes"?
failure	(optional) which value(s) indicate "failures"? If no input is provided for this argument, then all the non-NA values that are not declared to be "successes" will be treated as "failures".
р	hypothesized probability of success (default = 0.5)
alternative	indicates the alternative hypothesis and must be one of "two.sided", "greater", or "less". You can specify just the initial letter. By default, alternative = "two.sided"
ci	width of the confidence interval (default = 0.95)
round_percentages	
	number of decimal places to which to round the percentages in the summary table (default $= 0$)

```
# sample vector
sample_vector <- c(0, 1, 1, 0, 1, 98, 98, 99, NA)
binomial_test(
x = sample_vector,
success = 1, failure = 0)
binomial_test(</pre>
```

8 bracket

```
x = sample_vector,
success = 1, failure = 0,
p = 0.1,
alternative = "greater")
binomial_test(
x = sample_vector,
success = c(1, 99), failure = c(0, 98),
p = 0.6,
alternative = "less")
```

bracket

Draw a bracket on a ggplot

Description

Draw a square bracket with a label on a ggplot

Usage

```
bracket(
  xmin = NULL,
  xmax = NULL,
 ymin = NULL,
  ymax = NULL,
  vertical = NULL,
  horizontal = NULL,
  open = NULL,
  bracket_shape = NULL,
  thickness = 2,
  bracket_color = "black",
  label = NULL,
  label_hjust = NULL,
  label_vjust = NULL,
  label_font_size = 5,
  label_font_face = "bold",
  label_color = "black",
  label_parse = FALSE
)
```

Arguments

```
xminxminxmaxxmaxyminyminymaxymaxverticalvertical
```

capitalize 9

horizontal horizontal open open bracket_shape bracket_shape thickness thickness bracket_color bracket_color label label label_hjust label_hjust label_vjust label_vjust label_font_size label_font_size label_font_face label_font_face label_color label_font_face label_parse label_parse

Value

a ggplot object; there will be no meaningful output from this function. Instead, this function should be used with another ggplot object

Examples

```
library(ggplot2)
ggplot(mtcars, aes(x = cyl, y = mpg)) + geom_point() +
bracket(6.1, 6.2, 17, 22, bracket_shape = "]", label = "abc")
```

capitalize

Capitalize a substring

Description

Capitalizes the first letter (by default) or a substring of a given character string or each element of the character vector

Usage

```
capitalize(x, start = 1, end = 1)
```

Arguments

```
x a character string or a character vector

start starting position of the susbtring (default = 1)

end ending position of the susbtring (default = 1)
```

10 change_var_names

Value

a character string or a character vector

Examples

```
capitalize("abc")
capitalize(c("abc", "xyx"), start = 2, end = 3)
```

change_var_names

Change variable names in a data set

Description

Change variable names in a data set

Usage

```
change_var_names(
  data = NULL,
  old_var_names = NULL,
  new_var_names = NULL,
  skip_absent = FALSE,
  print_summary = TRUE,
  output_type = "dt"
)
```

Arguments

data a data object (a data frame or a data.table)

old_var_names a vector of old variable names (i.e., variable names to change)

new_var_names a vector of new variable names

skip_absent = TRUE, old variable names that do not exist in the data set will

be skipped (default = TRUE).

print_summary If print_summary = TRUE, a summary of old and new variable names will printed.

(default = TRUE)

output_type type of the output. If output_type = "dt", the function's output will be a

data.table with changed names. If output_type = "summary", the function's output will be a data.table listing old and new variable names. By default,

output_type = "dt".

Value

a data.table object with changed variable names

```
change_var_names(
mtcars, old = c("mpg", "cyl"), new = c("mpg_new", "cyl_new"))
```

check_modes 11

check_modes

Check modes of objects

Description

Check modes of objects

Usage

```
check_modes(..., mode_to_confirm = NULL)
```

Arguments

```
... R objects.
```

mode_to_confirm

The function will test whether each input is of this mode. For example, check_modes(a, mode_to_confirm = "numeric"), the function will check whether the object a is numeric.

Examples

```
check_modes(1L, mode_to_confirm = "numeric")
check_modes(
TRUE, FALSE, 1L, 1:3, 1.1, c(1.2, 1.3), "abc", 1 + 2i, intToBits(1L),
mode_to_confirm = "numeric")
```

check_req_pkg

Check for required packages

Description

Check whether required packages are installed.

Usage

```
check_req_pkg(pkg = NULL)
```

Arguments

pkg

a character vector containing names of packages to check

Value

there will be no output from this function. Rather, the function will check whether the packages given as inputs are installed.

chi_squared_test

Examples

```
check_req_pkg("data.table")
check_req_pkg(c("base", "utils", "ggplot2", "data.table"))
```

chi_squared_test

Chi-squared test

Description

Conduct a chi-squared test and produce a contingency table

Usage

```
chi_squared_test(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  round_chi_sq_test_stat = 2,
  round_p = 3,
  sigfigs_proportion = 2,
  correct = TRUE,
  odds_ratio_ci = 0.95,
  round_odds_ratio_ci_limits = 2,
  invert = FALSE
)
```

Arguments

data a data object (a data frame or a data.table) iv_name name of the independent variable dv_name name of the dependent variable (must be a binary variable) round_chi_sq_test_stat number of decimal places to which to round the chi-squared test statistic (default = 2)round_p number of decimal places to which to round the p-value from the chi-squared test (default = 3)sigfigs_proportion number of significant digits to round to (for the table of proportions). By default $sigfigs_proportion = 2$ logical. Should continuity correction be applied? (default = TRUE) correct

odds_ratio_ci width of the confidence interval for the odds ratio. Input can be any value less than 1 and greater than or equal to 0. By default, odds_ratio_ci = 0.95. If odds_ratio_ci = TRUE, the default value of 0.95 will be used. If odds_ratio_ci = FALSE, no confidence interval will be estimated for the odds ratio.

round_odds_ratio_ci_limits

number of decimal places to which to round the limits of the odds ratio's confidence interval (default = 2)

invert logical. Whether the inverse of the odds ratio (i.e., 1 / odds ratio) should be returned.

Examples

```
chi_squared_test(data = mtcars, iv_name = "cyl", dv_name = "am")
# if the iv has only two levels, odds ratio will also be calculated
chi_squared_test(data = mtcars, iv_name = "vs", dv_name = "am")
```

chi_squared_test_pairwise

Chi-squared test, pairwise

Description

Conducts a chi-squared test for every possible pairwise comparison with Bonferroni correction

Usage

```
chi_squared_test_pairwise(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  focal_dv_value = NULL,
  contingency_table = TRUE,
  contingency_table_sigfigs = 2,
  percent_and_total = FALSE,
  percentages_only = NULL,
  counts_only = NULL,
  sigfigs = 3,
  chi_sq_test_stats = FALSE,
  correct = TRUE
)
```

Arguments

data a data object (a data frame or a data.table)

iv_name name of the independent variable (must be a categorical variable)

dv_name name of the dependent variable (must be a binary variable)

focal_dv_value focal value of the dependent variable whose frequencies will be calculated (i.e., the value of the dependent variable that will be considered a "success" or a result of interest) contingency_table If contingency_table = TRUE or if contingency_table = "percentages", the percentage of each binary value within each group will be printed. If contingency_table = "counts", a table of frequencies will be printed. If contingency_table = FALSE, no contingency table will be printed. contingency_table_sigfigs number of significant digits that the contingency table's percentage values should be rounded to (default = 2)percent_and_total logical. If percent_and_total = TRUE, tabulate percentages of the focal DV value and a total count of the two values in DV. By default percent_and_total = FALSE percentages_only tabulate percentages of the focal DV value only tabulate counts of the focal DV value only counts_only number of significant digits to round to sigfigs chi_sq_test_stats if chi_sq_test_stats = TRUE, chi-squared test statistic and degrees of freedom will be included in the pairwise comparison data.table.

logical. Should continuity correction be applied? (default = TRUE)

Examples

correct

```
chi_squared_test_pairwise(data = mtcars, iv_name = "vs", dv_name = "am")
chi_squared_test_pairwise(data = mtcars, iv_name = "vs", dv_name = "am")
percentages_only = TRUE)
# using 3 mtcars data sets combined
chi_squared_test_pairwise(
data = rbind(mtcars, rbind(mtcars, mtcars)),
iv_name = "cyl", dv_name = "am")
# include the total counts
chi_squared_test_pairwise(
data = rbind(mtcars, rbind(mtcars, mtcars)),
iv_name = "cyl", dv_name = "am", percent_and_total = TRUE)
# display counts
chi_squared_test_pairwise(
data = rbind(mtcars, rbind(mtcars, mtcars)),
iv_name = "cyl", dv_name = "am", contingency_table = "counts")
```

clean_data_from_qualtrics

Clean data from Qualtrics

Description

Clean a data set downloaded from Qualtrics

Usage

```
clean_data_from_qualtrics(
  data = NULL,
  remove_survey_preview_data = TRUE,
  remove_test_response_data = TRUE,
  default_cols_by_qualtrics = NULL,
  default_cols_by_qualtrics_new = NULL,
  warn_accuracy_loss = FALSE,
  click_data_cols = "rm",
  page_submit_cols = "move_to_right"
)
```

Arguments

```
data
                  a data object (a data frame or a data.table)
remove_survey_preview_data
                  logical. Whether to remove data from survey preview (default = TRUE)
remove_test_response_data
                  logical. Whether to remove data from test response (default = TRUE)
default_cols_by_qualtrics
                  names of columns that Qualtrics includes in the data set by default (e.g., "Start-
                  Date", "Finished"). Accepting the default value default_cols_by_qualtrics
                  = NULL will set the names to be those that Qualtrics uses as of Dec 25, 2020.
default_cols_by_qualtrics_new
                  new names for columns that Qualtrics includes in the data set by default (e.g.,
                  "StartDate", "Finished"). Accepting the default value default_cols_by_qualtrics_new
                  = NULL will set the names to be those that Qualtrics uses as of Dec 25, 2020 con-
                  verted to snake_case (e.g., "start_date", "finished").
warn_accuracy_loss
                  logical. whether to warn the user if converting character to numeric leads to loss
                  of accuracy. (default = FALSE)
click_data_cols
                  if click_data_cols = "rm", columns containing click data (e.g., "_First Click")
                  will be removed. If click_data_cols = "move_to_right", the columns will
                  be moved to the right (end) of the data set.
page_submit_cols
                  if page_submit_cols = "rm", columns containing page submit data (e.g., " Page
                  Submit"; "response time" data) will be removed. If page_submit_cols = "move_to_right",
                  the columns will be moved to the right (end) of the data set.
```

Value

a data.table object

16 cohen_d

Examples

```
clean_data_from_qualtrics(mtcars)
clean_data_from_qualtrics(mtcars, default_cols_by_qualtrics = "mpg",
default_cols_by_qualtrics_new = "mpg2")
```

```
coefficent_of_variation
```

Coefficient of variation

Description

Calculates the (population or sample) coefficient of variation of a given numeric vector

Usage

```
coefficent_of_variation(vector, pop_or_sample = "pop")
```

Arguments

```
vector a numeric vector
```

pop_or_sample should coefficient of variation be calculated for a "population" or a "sample"?

Value

a numeric value

Examples

```
coefficent_of_variation(1:4, pop_or_sample = "sample")
coefficent_of_variation(1:4, pop_or_sample = "pop")
```

cohen_d

Calculate Cohen's d and its confidence interval using the package 'psych'

Description

To run this function, the following package(s) must be installed: Package 'psych' v2.1.9 (or possibly a higher version) by William Revelle (2021), https://cran.r-project.org/package=psych

cohen_d_borenstein 17

Usage

```
cohen_d(
  sample_1 = NULL,
  sample_2 = NULL,
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  ci_range = 0.95,
  output_type = "all"
)
```

Arguments

a vector of values in the first of two samples sample_1 sample_2 a vector of values in the second of two samples data a data object (a data frame or a data.table) name of the independent variable iv_name dv_name name of the dependent variable range of the confidence interval for Cohen's d (default = 0.95) ci_range If output_type == "all" or if output_type == "d_and_ci", the output will be output_type a vector of Cohen's d and its confidence interval. If output_type == "d", the output will be Cohen's d. If output_type == "ci", the output will be a vector of the confidence interval around Cohen's d. By default, output_type == "all".

Examples

```
## Not run:
cohen_d(sample_1 = 1:10, sample_2 = 3:12)
cohen_d(data = mtcars, iv_name = "vs", dv_name = "mpg", ci_range = 0.99)
sample_dt <- data.table::data.table(iris)[Species != "setosa"]
cohen_d(data = sample_dt, iv_name = "Species", dv_name = "Petal.Width")
## End(Not run)</pre>
```

cohen_d_borenstein

Calculate Cohen's d as illustrated by Borenstein et al. (2009, ISBN: 978-0-470-05724-7)

Description

Calculates Cohen's d, its standard error, and confidence interval, as illustrated in the Borenstein et al. (2009, ISBN: 978-0-470-05724-7).

18 cohen_d_borenstein

Usage

```
cohen_d_borenstein(
  sample_1 = NULL,
  sample_2 = NULL,
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  direction = "2_minus_1",
  ci_range = 0.95,
  output_type = "all",
  initial_value = 0
)
```

Arguments

sample_1 a vector of values in the first of two samples sample_2 a vector of values in the second of two samples data a data object (a data frame or a data.table)

iv_name name of the independent variable dv_name name of the dependent variable

direction == "2_minus_1", Cohen's d will reflect the extent to which the

mean of IV level 2 is greater than the mean of IV level 2. If direction == "1_minus_2", Cohen's d will reflect the extent to which the mean of IV level 1 is greater than the mean of IV level 2. By default, direction == "2_minus_1".

ci_range range of the confidence interval for Cohen's d (default = 0.95)

output_type = "all" or if output_type == "d_var_se_and_ci", the out-

put will be a vector of Cohen's d and its variance, SE, and confidence interval. If output_type == "d_se_and_ci", the output will be a vector of Cohen's d and its SE and confidence interval. If output_type == "d_and_ci", the output will be a vector of Cohen's d and its confidence interval. If output_type == "d", the output will be Cohen's d. If output_type == "ci", the output will be a vector of the confidence interval around Cohen's d. If output_type == "se", the output will be the standard error of Cohen's d. By default, output_type ==

"all".

initial_value initial value of the noncentrality parameter for optimization (default = 0). Adjust

this value if confidence interval results look strange.

```
cohen_d_borenstein(sample_1 = 1:10, sample_2 = 3:12)
cohen_d_borenstein(
data = mtcars, iv_name = "vs", dv_name = "mpg", ci_range = 0.99)
sample_dt <- data.table::data.table(iris)[Species != "setosa"]
cohen_d_borenstein(
data = sample_dt, iv_name = "Species", dv_name = "Petal.Width",
initial_value = 10)</pre>
```

```
cohen_d_for_one_sample
```

Calculate Cohen's d to accompany a one-sample t-test

Description

To run this function, the following package(s) must be installed: Package 'psych' v2.1.9 (or possibly a higher version) by William Revelle (2021), https://cran.r-project.org/package=psych

Usage

```
cohen_d_for_one_sample(x = NULL, mu = NULL)
```

Arguments

```
x a numeric vector containing values whose mean will be calculated mu the true mean
```

Examples

```
 cohen\_d\_for\_one\_sample(x = 1:10, mu = 3) \\  cohen\_d\_for\_one\_sample(x = c(1:10, NA, NA), mu = 3)
```

```
cohen_d_from_cohen_textbook
```

Cohen's d from Jacob Cohen's textbook (1988)

Description

Calculates Cohen's d as described in Jacob Cohen's textbook (1988), Statistical Power Analysis for the Behavioral Sciences, 2nd Edition Cohen, J. (1988) doi:10.4324/9780203771587

Usage

```
cohen_d_from_cohen_textbook(
  sample_1 = NULL,
  sample_2 = NULL,
  data = NULL,
  iv_name = NULL,
  dv_name = NULL
```

cohen_d_over_n

Arguments

```
sample_1 a vector of values in the first of two samples
sample_2 a vector of values in the second of two samples
data a data object (a data frame or a data.table)
iv_name name of the independent variable
dv_name name of the dependent variable
```

Value

the output will be a Cohen's d value (a numeric vector of length one)

Examples

```
cohen_d_from_cohen_textbook(1:10, 3:12)
cohen_d_from_cohen_textbook(
  data = mtcars, iv_name = "vs", dv_name = "mpg"
)
```

cohen_d_over_n

Cohen's d as a function of sample size

Description

Plot Cohen's d as sample size increases.

Usage

```
cohen_d_over_n(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  save_as_png = FALSE,
  png_name = NULL,
  xlab = NULL,
  ylab = NULL,
  width = 16,
  height = 9
)
```

Arguments

data a data object (a data frame or a data.table)

iv_name name of the independent variable (grouping variable)

dv_name name of the dependent variable (measure variable of interest)

save_as_png if save = TRUE, the plot will be saved as a PNG file.

cohen_d_torchiano 21

png_name	name of the PNG file to be saved. By default, the name will be "cohen_d_over_n_" followed by a timestamp of the current time. The timestamp will be in the format, jan_01_2021_1300_10_000001, where "jan_01_2021" would indicate January 01, 2021; 1300 would indicate 13:00 (i.e., 1 PM); and 10_000001 would indicate 10.000001 seconds after the hour.
xlab	title of the x-axis for the histogram by group. If $xlab = FALSE$, the title will be removed. By default (i.e., if no input is given), dv_n mame will be used as the title.
ylab	title of the y-axis for the histogram by group. If ylab = FALSE, the title will be removed. By default (i.e., if no input is given), iv_name will be used as the title.
width	width of the plot to be saved. This argument will be directly entered as the width argument for the ggsave function within ggplot2 package (default = 16)
height	height of the plot to be saved. This argument will be directly entered as the height argument for the ggsave function within ggplot2 package (default = 9)

Value

the output will be a list of (1) ggplot object (histogram by group) and (2) a data.table with Cohen's d by sample size

Examples

```
## Not run:
cohen_d_over_n(data = mtcars, iv_name = "am", dv_name = "mpg")
## End(Not run)

cohen_d_torchiano

Calculate Cohen's d and its confidence interval using the package 'eff-
size'
```

Description

To run this function, the following package(s) must be installed: Package 'effsize' v0.8.1 (or possibly a higher version) by Marco Torchiano (2020), https://cran.r-project.org/package=effsize

Usage

```
cohen_d_torchiano(
  sample_1 = NULL,
  sample_2 = NULL,
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  ci_range = 0.95
)
```

cohen_d_to_r

Arguments

sample_1 a vector of values in the first of two samples
sample_2 a vector of values in the second of two samples
data a data object (a data frame or a data.table)
iv_name name of the independent variable
dv_name name of the dependent variable
ci_range range of the confidence interval for Cohen's d (default = 0.95)

Examples

```
cohen_d_torchiano(1:10, 3:12)
cohen_d_torchiano(
data = mtcars, iv_name = "vs", dv_name = "mpg", ci_range = 0.99)
```

cohen_d_to_r

Convert Cohen's d to r

Description

Convert d (standardized mean difference or Cohen's d) to r (correlation), as illustrated in Borenstein et al. (2009, p. 48, ISBN: 978-0-470-05724-7)

Usage

```
cohen_d_to_r(d = NULL, n1 = NULL, n2 = NULL, d_var = NULL)
```

Arguments

d	Cohen's d (the input can be a vector of values)
n1	sample size in the first of two group (the input can be a vector of values)
n2	sample size in the second of two group (the input can be a vector of values)
d_var	(optional argument) variance of d (the input can be a vector of values). If this argument receives an input, variance of r will be returned as well.

Value

the output will be a vector of correlation values (and variances of r if the argument d_var received an input)

Examples

```
## Not run:
cohen_d_to_r(1)
cohen_d_to_r(d = 1:3)
cohen_d_to_r(d = 1:3, n1 = c(100, 200, 300), n2 = c(50, 250, 900))
cohen_d_to_r(1.1547)
cohen_d_to_r(d = 1.1547, d_var = .0550)
cohen_d_to_r(d = 1:2, d_var = 1:2)
## End(Not run)
```

combine_data_across_cols

Combine data across columns

Description

Combine data across columns. If NA is the only value across all focal columns for given row(s), NA will be returned for those row(s).

Usage

```
combine_data_across_cols(data = NULL, cols = NULL)
```

Arguments

data a data object (a data frame or a data.table)

cols a character vector containing names of columns, across which to combine data

Value

the output will be a numeric or character vector.

```
 \begin{array}{l} dt <-\ data.frame(v1=c(1,\ NA),\ v2=c(NA,\ 2)) \\ dt \\ combine_data_across_cols(data=dt,\ cols=c("v1",\ "v2")) \\ dt <-\ data.frame(v1=c(1,\ 2,\ NA),\ v2=c(NA,\ 4,\ 3)) \\ dt \\ combine_data_across_cols(data=dt,\ cols=c("v1",\ "v2")) \\ dt <-\ data.frame(v1=c(1,\ NA,\ NA),\ v2=c(NA,\ 2,\ NA)) \\ dt \\ combine_data_across_cols(data=dt,\ cols=c("v1",\ "v2")) \\ \end{array}
```

24 compare_datasets

```
comma_sep_string_to_numbers
```

Convert a comma-separated string of numbers

Description

Convert a comma-separated string of numbers

Usage

```
comma_sep_string_to_numbers(string)
```

Arguments

string

a character string consisting of numbers separated by commas

Value

a character string

Examples

```
comma_sep_string_to_numbers("1, 2, 3,4, 5 6")
```

compare_datasets

Compare data sets

Description

Compares whether or not data sets are identical

Usage

```
compare_datasets(dataset_1 = NULL, dataset_2 = NULL, dataset_list = NULL)
```

Arguments

dataset_1 a data object (a data frame or a data.table)
dataset_2 another data object (a data frame or a data.table)
dataset_list list of data objects (data.frame or data.table)

Value

the output will be a data.table showing differences in data sets

Examples

```
# catch differences in class attributes of the data sets
compare_datasets(
dataset_1 = data.frame(a = 1:2, b = 3:4),
dataset_2 = data.table::data.table(a = 1:2, b = 3:4))
# catch differences in number of columns
compare_datasets(
dataset_1 = data.frame(a = 1:2, b = 3:4, c = 5:6),
dataset_2 = data.frame(a = 1:2, b = 3:4))
# catch differences in number of rows
compare_datasets(
dataset_1 = data.frame(a = 1:2, b = 3:4),
dataset_2 = data.frame(a = 1:10, b = 11:20))
# catch differences in column names
compare_datasets(
dataset_1 = data.frame(A = 1:2, B = 3:4),
dataset_2 = data.frame(a = 1:2, b = 3:4))
# catch differences in values within corresponding columns
compare_datasets(
dataset_1 = data.frame(a = 1:2, b = c(3, 400)),
dataset_2 = data.frame(a = 1:2, b = 3:4))
compare_datasets(
dataset_1 = data.frame(a = 1:2, b = 3:4, c = 5:6),
dataset_2 = data.frame(a = 1:2, b = c(3, 4), c = c(5, 6)))
# check if data sets in a list are identical
compare_datasets(
dataset_list = list(
dt1 = data.frame(a = 1:2, b = 3:4, c = 5:6),
dt2 = data.frame(a = 1:2, b = 3:4),
dt3 = data.frame(a = 1:2, b = 3:4, c = 5:6)))
```

compare_dependent_rs Compare dependent correlations

Description

Compares whether two dependent correlations from the same sample are significantly different each other.

Usage

```
compare_dependent_rs(
  data = NULL,
  var_1_name = NULL,
  var_2_name = NULL,
  var_3_name = NULL,
  one_tailed = FALSE,
  round_r = 3,
  round_p = 3,
```

```
round_t = 2,
print_summary = TRUE,
return_dt = FALSE
)
```

Arguments

data	a data object (a data frame or a data.table)
var_1_name	name of the variable whose correlations with two other variables will be compared.
var_2_name	name of the first of the two variables whose correlations with var_1 -name will be compared.
var_3_name	name of the second of the two variables whose correlations with var_1_name will be compared.
one_tailed	logical. Should the p value based on a one-tailed t-test? (default = FALSE)
round_r	number of decimal places to which to round correlation coefficients (default $=$ 2)
round_p	number of decimal places to which to round p-values (default = 3)
round_t	number of decimal places to which to round the t-statistic (default = 2)
print_summary	logical. Should the summary be printed? (default = TRUE)
return_dt	logical. Should the function return a summary table as an output, as opposed to returning the output through the "invisible" function? (default = FALSE)

Details

Suppose that Variables A, B, and C are measured from a group of subjects. This function tests whether A is related to B differently than to C. Put differently, this function tests H0: r(A, B) = r(A, C)

For more information on formulas used in this function, please refer to Steiger (1980) doi:10.1037/00332909.87.2.245 and Chen & Popovich (2002) doi:10.4135/9781412983808

Value

the output will be a summary of the test comparing two dependent correlations

```
compare_dependent_rs(
data = mtcars, var_1_name = "mpg", var_2_name = "hp", var_3_name = "wt")
```

compare_effect_sizes 27

Description

Compares effect sizes See p. 156 of Borenstein et al. (2009, ISBN: 978-0-470-05724-7).

Usage

```
compare_effect_sizes(
  effect_sizes = NULL,
  effect_size_variances = NULL,
  round_stats = TRUE,
  round_p = 3,
  round_se = 2,
  round_z = 2,
  pretty_round_p_value = TRUE
)
```

Arguments

```
a vector of estimated effect sizes
effect_sizes
effect_size_variances
                  a vector of variances of the effect sizes
round_stats
                  logical. Should the statistics be rounded? (default = TRUE)
                  number of decimal places to which to round p-values (default = 3)
round_p
                  number of decimal places to which to round the standard errors of the difference
round_se
                  (default = 2)
round_z
                  number of decimal places to which to round the z-statistic (default = 2)
pretty_round_p_value
                  logical. Should the p-values be rounded in a pretty format (i.e., lower threshold:
                  "<.001"). By default, pretty_round_p_value = TRUE.
```

```
compare_effect_sizes(
effect_sizes = c(0.6111, 0.3241, 0.5),
effect_size_variances = c(.0029, 0.0033, 0.01))
```

28 compare_groups

compare_groups

Compare groups

Description

Compares groups by (1) creating histogram by group; (2) summarizing descriptive statistics by group; and (3) conducting pairwise comparisons (t-tests and Mann-Whitney tests).

Usage

```
compare_groups(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  sigfigs = 3,
  stats = "basic",
  cohen_d = TRUE,
  cohen_d_w_ci = TRUE,
  adjust_p = "holm",
  bonferroni = NULL,
 mann_whitney = TRUE,
  t_test_stats = TRUE,
  t_test_df_decimals = 1,
  round_p = 3,
  save_as_png = FALSE,
  png_name = NULL,
  xlab = NULL,
 ylab = NULL,
  x_limits = NULL,
 x_breaks = NULL,
  x_{labels} = NULL,
 width = 5000,
  height = 3600,
  units = "px",
  res = 300,
  layout_matrix = NULL,
  col_names_nicer = TRUE,
  convert_dv_to_numeric = TRUE
)
```

Arguments

data	a data object (a data frame or a data.table)
iv_name	name of the independent variable (grouping variable)
dv_name	name of the dependent variable (measure variable of interest)
sigfigs	number of significant digits to round to

compare_groups 29

stats statistics to calculate for each group. If stats = "basic", group size, mean, standard deviation, median, minimum, and maximum will be calculated. If stats = "all", in addition to the aforementioned statistics, standard error, 95% confidence and prediction intervals, skewness, and kurtosis will also be calculated. The stats argument can also be a character vector with types of statistics to calculate. For example, entering stats = c("mean", "median") will calculate mean and median. By default, stats = "basic" cohen d if cohen_d = TRUE, Cohen's d statistics will be included in the pairwise comparison data.table. if cohen_d_w_ci = TRUE, Cohen's d with 95% CI will be included in the output cohen d w ci data.table. adjust_p the name of the method to use to adjust p-values. If adjust_p = "holm", the Holm method will be used; if adjust_p = "bonferroni", the Bonferroni method will be used. By default, adjust_p = "holm" bonferroni The use of this argument is deprecated. Use the 'adjust_p' argument instead. If bonferroni = TRUE, Bonferroni tests will be conducted for t-tests or Mann-Whitney tests. if TRUE, Mann-Whitney test results will be included in the pairwise comparison mann_whitney data.table. If FALSE, Mann-Whitney tests will not be performed. if t_test_stats = FALSE, t-test statistic and degrees of freedom will be ext_test_stats cluded in the pairwise comparison data.table. t_test_df_decimals number of decimals for the degrees of freedom in t-tests (default = 1) round_p number of decimal places to which to round p-values (default = 3) if save = "all" or if save = TRUE, the histogram by group, descriptive statistics save_as_png by group, and pairwise comparison results will be saved as a PNG file. name of the PNG file to be saved. By default, the name will be "compare_groups_results_" png_name followed by a timestamp of the current time. The timestamp will be in the format, jan 01 2021 1300 10 000001, where "jan 01 2021" would indicate January 01, 2021; 1300 would indicate 13:00 (i.e., 1 PM); and 10_000001 would indicate 10.000001 seconds after the hour. xlab title of the x-axis for the histogram by group. If xlab = FALSE, the title will be removed. By default (i.e., if no input is given), dv_name will be used as the title. ylab title of the y-axis for the histogram by group. If ylab = FALSE, the title will be removed. By default (i.e., if no input is given), iv_name will be used as the title. x_limits a numeric vector with values of the endpoints of the x axis. x_breaks a numeric vector indicating the points at which to place tick marks on the x axis. x_labels a vector containing labels for the place tick marks on the x axis. width width of the PNG file (default = 4000) height height of the PNG file (default = 3000) units the units for the width and height arguments. Can be "px" (pixels), "in" (inches), "cm", or "mm". By default, units = "px".

The nominal resolution in ppi which will be recorded in the png file, if a positive integer. Used for units other than the default. If not specified, taken as 300 ppi

to set the size of text and line widths.

layout_matrix The layout argument for arranging plots and tables using the grid.arrange

function.

col_names_nicer

if col_names_nicer = TRUE, column names will be converted from snake_case

to an easier-to-eye format.

convert_dv_to_numeric

logical. Should the values in the dependent variable be converted to numeric for

plotting the histograms? (default = TRUE)

holm if holm = TRUE, the relevant p values will be adjusted using Holm method (also

known as the Holm-Bonferroni or Bonferroni-Holm method)

Value

the output will be a list of (1) ggplot object (histogram by group) (2) a data.table with descriptive statistics by group; and (3) a data.table with pairwise comparison results. If save_as_png = TRUE, the plot and tables will be also saved on local drive as a PNG file.

Examples

```
## Not run:
compare_groups(data = iris, iv_name = "Species", dv_name = "Sepal.Length")
compare_groups(data = iris, iv_name = "Species", dv_name = "Sepal.Length",
x_breaks = 4:8)
## End(Not run)
```

compare_independent_rs

Compare independent correlations

Description

Compares whether two correlations from two independent samples are significantly different each other. See Field et al. (2012, ISBN: 978-1-4462-0045-2).

Usage

```
compare_independent_rs(
  r1 = NULL,
  n1 = NULL,
  r2 = NULL,
  n2 = NULL,
  one_tailed = FALSE,
  round_p = 3,
```

contingency_table 31

```
round_z_diff = 2,
round_r = 2,
print_summary = TRUE,
output_type = NULL
)
```

Arguments

r1	correlation in the first sample
n1	size of the first sample
r2	correlation in the second sample
n2	size of the first sample
one_tailed	logical. Should the p value based on a one-tailed t-test? (default = FALSE)
round_p	(only for displaying purposes) number of decimal places to which to round the p-value (default $= 3$)
round_z_diff	(only for displaying purposes) number of decimal places to which to round the z-score (default $= 2$)
round_r	(only for displaying purposes) number of decimal places to which to round correlation coefficients (default $= 2$)
print_summary	logical. Should the summary be printed? (default = TRUE)
output_type	type of the output. If output_type = "z", the function's output will be the z-score of the difference between the two correlations. If output_type = "p", the function's output will be the p-value associated with the z-score of the difference between the two correlations. By default, output_type = NULL, and the function will not return any value other than the printed summary.

Value

the output will be the results of a test comparing two independent correlations.

Examples

```
compare_independent_rs(r1 = .1, n1 = 100, r2 = .2, n2 = 200) compare_independent_rs( r1 = .1, n1 = 100, r2 = .2, n2 = 200, one_tailed = TRUE) compare_independent_rs(r1 = .506, n1 = 52, r2 = .381, n2 = 51)
```

contingency_table

Contingency table

Description

Create a contingency table that takes two variables as inputs

Usage

```
contingency_table(
  data = NULL,
  row_var_name = NULL,
  col_var_name = NULL,
  row = NULL,
  col = NULL,
  output_type = "table"
)
```

Arguments

a data object (a data frame or a data.table)

row_var_name

name of the variable whose values will fill the rows of the contingency table

row

a vector whose values will fill the rows of the contingency table

a vector whose values will fill the rows of the contingency table

a vector whose values will fill the columns of the contingency table

output_type

If output_type == "dt" the output will be a contingency table as a data.table object. If output_type == "table" the output will be a contingency table as a table object. If output_type == "df" the output will be a contingency table as a data.frame object. By default, output_type == "table".

Examples

```
contingency_table(
data = mtcars,
row_var_name = "am",
col_var_name = "cyl")
contingency_table(row = mtcars$cyl, col = mtcars$am)
contingency_table(mtcars, "am", "cyl", output_type = "dt")
```

```
convert_cols_to_numeric
```

Convert columns to numeric

Description

Check whether each column in a data.table can be converted to numeric, and if so, convert every such column.

Usage

```
convert_cols_to_numeric(
  data = NULL,
  classes = "character",
  warn_accuracy_loss = TRUE,
```

```
print_summary = TRUE,
    silent = FALSE
)
```

Arguments

data a data object (a data frame or a data.table)

classes a character vector specifying classes of columns that will be converted. For

example, if classes = "character", all columns of the class "character" will be converted—if they can be converted. The current version of the function only

supports converting character columns to numeric.

warn_accuracy_loss

logical. whether to warn the user if converting character to numeric leads to loss

of accuracy. (default = TRUE)

print_summary If print_summary = TRUE, a summary of converted columns will printed. (de-

fault = TRUE)

silent If silent = FALSE, a message regarding conversion for a data.frame will be

printed. If silent = TRUE, this message will be suppressed. By default, silent

= FALSE.

Examples

```
data_frame_1 <- data.frame(a = c("1", "2"), b = c("1", "b"), c = 1:2)
convert_cols_to_numeric(data = data_frame_1)
data_table_1 <- data.table::data.table(
a = c("1", "2"), b = c("1", "b"), c = 1:2)
convert_cols_to_numeric(data = data_table_1)</pre>
```

```
convert_to_excel_formula
```

Convert character to Excel formula

Description

Convert elements of a character vector to Excel formulas to preserve the character (string) format when opened in an Excel file.

Usage

```
convert_to_excel_formula(vector = NULL)
```

Arguments

vector a character vector

34 correlation_kim

Value

the output will be a character vector formatted as an Excel formula. For example, if an element in the input vector was ".500", this element will be converted to =".500", which will show up as ".500" in Excel, rather than as "0.5"

Examples

```
## Not run:
# compare the two csv files below
# example 1
dt <- data.table::data.table(a = ".500")
data.table::fwrite(dt, "example1.csv") # the csv will show "0.5"
# example 2
dt <- data.table::data.table(a = convert_to_excel_formula(".500"))
data.table::fwrite(dt, "example2.csv") # the csv will show ".500"
## End(Not run)</pre>
```

correlation_kim

Estimate the correlation between two variables

Description

Estimate the correlation between two variables

Usage

```
correlation_kim(
  x = NULL,
  y = NULL,
  data = NULL,
  x_var_name = NULL,
  y_var_name = NULL,
  ci_range = 0.95,
  round_r = 2,
  round_p = 3,
  output_type = "summary"
)
```

Arguments

```
x a numeric vector of data values
y a numeric vector of data values
data (optional) a data object (a data frame or a data.table)
x_var_name (optional) name of the first variable (if using a data set as an input)
y_var_name (optional) name of the second variable (if using a data set as an input)
```

correlation_matrix 35

```
range of the confidence interval for the correlation coefficient. If ci_range = FALSE, no confidence interval will be estimated. By default, ci_range = 0.95.

round_r number of decimal places to which to round correlation coefficients (default = 2)

round_p number of decimal places to which to round p-values (default = 3)

output_type of the output. If output_type = "dt", the function's output will be a data.table with the results from the correlation analysis. If output_type = "summary", the function's output will be a statement (a string) summarizing the results from the correlation analysis. By default, output_type = "summary"
```

Examples

```
## Not run:
correlation_kim(x = 1:4, y = c(1, 3, 2, 4))
correlation_kim(x = 1:4, y = c(1, 3, 2, 4), ci_range = FALSE)
# output as a data table
correlation_kim(x = 1:4, y = c(1, 3, 2, 4), output_type = "dt")
## End(Not run)
```

correlation_matrix

correlation matrix

Description

Creates a correlation matrix

Usage

```
correlation_matrix(
  data = NULL,
  var_names = NULL,
  row_var_names = NULL,
  col_var_names = NULL,
  round_r = 2,
  round_p = 3,
  output_type = "r"
)
```

Arguments

a data object (a data frame or a data.table)

var_names

names of the variables for which to calculate all pairwise correlations

row_var_names

names of the variables that will go on the rows of the correlation matrix

names of the variables that will go on the columns of the correlation matrix

36 cum_percent_plot

round_r number of decimal places to which to round correlation coefficients (default =

2)

round_p number of decimal places to which to round p-values (default = 3)

output_type which value should be filled in cells of the correlation matrix? If output_type =

"r", correlation coefficients; if output_type = "p", p-values; if output_type = "rp", correlation coefficients with significance symbols based on p-values; if output_type = "n", sizes of the samples used to calculate the correlation

coefficients

Value

the output will be a correlation matrix in a data.table format

Examples

```
correlation_matrix(data = mtcars, var_names = c("mpg", "cyl", "wt"))
correlation_matrix(data = mtcars,
row_var_names = c("mpg", "cyl", "hp"), col_var_names = c("wt", "am"))
```

cum_percent_plot

Cumulative percentage plot

Description

Plots or tabulates cumulative percentages associated with elements in a vector

Usage

```
cum_percent_plot(vector, output_type = "plot")
```

Arguments

vector a numeric vector

output_type if output_type = "plot", return a cumulative percentage plot; if output_type

= "dt", return a data.table with cumulative percentages. By default, output_type

= "plot"

```
cum_percent_plot(c(1:100, NA, NA))
cum_percent_plot(mtcars$mpg)
cum_percent_plot(vector= mtcars$mpg, output_type = "dt")
```

desc_stats 37

desc_stats

Descriptive statistics

Description

Returns descriptive statistics for a numeric vector.

Usage

```
desc_stats(
  vector = NULL,
  output_type = "vector",
  sigfigs = 3,
  se_of_mean = FALSE,
  ci = FALSE,
  pi = FALSE,
  skewness = FALSE,
  kurtosis = FALSE,
  notify_na_count = NULL,
  print_dt = FALSE
)
```

Arguments

vector	a numeric vector	
output_type	if output_type = "vector", return a vector of descriptive statistics; if output_type = "dt", return a data.table of descriptive statistics (default = "vector")	
sigfigs	number of significant digits to round to (default = 3)	
se_of_mean	logical. Should the standard errors around the mean be included in the descriptive stats? (default = FALSE)	
ci	logical. Should 95% CI be included in the descriptive stats? (default = FALSE)	
pi	logical. Should 95% PI be included in the descriptive stats? (default = FALSE)	
skewness	logical. Should the skewness statistic be included in the descriptive stats? (default = FALSE)	
kurtosis	logical. Should the kurtosis statistic be included in the descriptive stats? (default = FALSE)	
notify_na_count		
	if TRUE, notify how many observations were removed due to missing values. By default, NA count will be printed only if there are any NA values.	
print_dt	if TRUE, print the descriptive stats data.table	

Value

if output_type = "vector", the output will be a named numeric vector of descriptive statistics; if output_type = "dt", the output will be data.table of descriptive statistics.

Examples

```
desc_stats(1:100)
desc_stats(1:100, ci = TRUE, pi = TRUE, sigfigs = 2)
desc_stats(1:100, se_of_mean = TRUE,
ci = TRUE, pi = TRUE, sigfigs = 2,
skewness = TRUE, kurtosis = TRUE)
desc_stats(c(1:100, NA))
example_dt <- desc_stats(vector = c(1:100, NA), output_type = "dt")
example_dt</pre>
```

desc_stats_by_group

Descriptive statistics by group

Description

Returns descriptive statistics by group

Usage

```
desc_stats_by_group(
  data = NULL,
  var_for_stats = NULL,
  grouping_vars = NULL,
  stats = "all",
  sigfigs = NULL,
  cols_to_round = NULL
)
```

Arguments

data a data object (a data frame or a data.table)

var_for_stats name of the variable for which descriptive statistics will be calculated

grouping_vars name(s) of grouping variables

stats statistics to calculate. If stats = "basic", group size, mean, standard devia-

tion, median, minimum, and maximum will be calculated. If stats = "all", in addition to the aforementioned statistics, standard error, 95% confidence and prediction intervals, skewness, and kurtosis will also be calculated. The stats argument can also be a character vector with types of statistics to calculate. For example, entering stats = c("mean", "median") will calculate mean and me-

dian. By default, stats = "all"

sigfigs number of significant digits to round to

cols_to_round names of columns whose values will be rounded

Value

the output will be a data.table showing descriptive statistics of the variable for each of the groups formed by the grouping variables.

Examples

```
desc_stats_by_group(data = mtcars, var_for_stats = "mpg",
grouping_vars = c("vs", "am"))
desc_stats_by_group(data = mtcars, var_for_stats = "mpg",
grouping_vars = c("vs", "am"), sigfigs = 3)
desc_stats_by_group(data = mtcars, var_for_stats = "mpg",
grouping_vars = c("vs", "am"), stats = "basic", sigfigs = 2)
desc_stats_by_group(data = mtcars, var_for_stats = "mpg",
grouping_vars = c("vs", "am"), stats = "basic", sigfigs = 2,
cols_to_round = "all")
desc_stats_by_group(data = mtcars, var_for_stats = "mpg",
grouping_vars = c("vs", "am"), stats = c("mean", "median"), sigfigs = 2,
cols_to_round = "all")
```

detach_user_installed_pkgs

Detach all user-installed packages

Description

Detach all user-installed packages

Usage

```
detach_user_installed_pkgs(exceptions = NULL, force = FALSE, keep_kim = TRUE)
```

Arguments

exceptions a character vector of names of packages to keep attached

force logical. Should a package be detached even though other attached packages

depend on it? By default, force = FALSE

keep_kim logical. If keep_kim = FALSE, Package 'kim' will be detached along with all

other user-installed packages. If keep_kim = TRUE, Package 'kim' will not be

detached. By default, keep_kim = FALSE

```
## Not run:
detach_user_installed_pkgs()
## End(Not run)
```

40 duplicated_values

Description

Return all duplicated values in a vector. This function is a copy of the earlier function, find_duplicates, in Package 'kim'

Usage

```
duplicated_values(vector = NULL, na.rm = TRUE, sigfigs = 2, output = "summary")
```

Arguments

vector	a vector whose elements will be checked for duplicates
na.rm	logical. If na.rm = TRUE, NA values in the vector will be removed before searching for duplicates. If na.rm = FALSE, NA values will be included in the search as potentially duplicated values. By default, na.rm = TRUE.
sigfigs	number of significant digits to round to in the percent column of the summary $(default = 2)$
output	type of output. If output = "summary", the function's output will be a data.table summarizing duplicated values and their counts. If output = "duplicated_values", the function's output will be a vector of duplicated values. If output = "non_duplicated_values", the function's output will be a vector of non-duplicated values (default = "summary")

Value

the output will be a data.table object (summary), a vector of duplicated values, or a vector non-duplicated values.

```
duplicated_values(mtcars$cyl)
duplicated_values(mtcars$cyl, output = "duplicated_values")
duplicated_values(vector = c(mtcars$cyl, 11:20, NA, NA))
duplicated_values(vector = c(mtcars$cyl, 11:20, NA, NA), na.rm = FALSE)
duplicated_values(vector = c(mtcars$cyl, 11:20, NA, NA),
na.rm = FALSE, sigfigs = 4, output = "duplicated_values")
```

excel_formula_convert

```
excel_formula_convert Excel formula, convert (to)
```

Description

Alias for the 'convert_to_excel_formula' function. Convert elements of a character vector to Excel formulas to preserve the character (string) format when opened in an Excel file.

Usage

```
excel_formula_convert(vector = NULL)
```

Arguments

vector

a character vector

Value

the output will be a character vector formatted as an Excel formula. For example, if an element in the input vector was ".500", this element will be converted to =".500", which will show up as ".500" in Excel, rather than as "0.5"

Examples

```
## Not run:
# compare the two csv files below
# example 1
dt <- data.table::data.table(a = ".500")
data.table::fwrite(dt, "example1.csv") # the csv will show "0.5"
# example 2
dt <- data.table::data.table(a = excel_formula_convert(".500"))
data.table::fwrite(dt, "example2.csv") # the csv will show ".500"
## End(Not run)</pre>
```

```
exit_from_parent_function
```

Exit from a Parent Function

Description

Exit from a Parent Function

find_duplicates

Usage

```
exit_from_parent_function(
  n = 1,
  silent = FALSE,
  message = "Exiting from a parent function"
)
```

Arguments

```
n the number of generations to go back (default = 1)
silent logical. If silent = TRUE, a message will be printed.
message message to print
```

Examples

```
fn1 <- function() {
  print(1)
  print(2)
}
fn1()
fn2 <- function() {
  print(1)
  exit_from_parent_function()
  print(2)
}
fn2()</pre>
```

find_duplicates

Find duplicated values in a vector

Description

Find duplicated values in a vector

Usage

```
find_duplicates(vector = NULL, na.rm = TRUE, sigfigs = 2, output = "summary")
```

Arguments

vector	a vector whose elements will be checked for duplicates
na.rm	logical. If na.rm = TRUE, NA values in the vector will be removed before searching for duplicates. If na.rm = FALSE, NA values will be included in the search as potentially duplicated values. By default, na.rm = TRUE.
sigfigs	number of significant digits to round to in the percent column of the summary (default = 2)

fisher_z_transform 43

output

type of output. If output = "summary", the function's output will be a data.table summarizing duplicated values and their counts. If output = "duplicated_values", the function's output will be a vector of duplicated values. If output = "non_duplicated_values", the function's output will be a vector of non-duplicated values (default = "summary")

Value

the output will be a data.table object (summary), a vector of duplicated values, or a vector non-duplicated values.

Examples

```
find_duplicates(mtcars$cyl)
find_duplicates(mtcars$cyl, output = "duplicated_values")
find_duplicates(vector = c(mtcars$cyl, 11:20, NA, NA))
find_duplicates(vector = c(mtcars$cyl, 11:20, NA, NA), na.rm = FALSE)
find_duplicates(vector = c(mtcars$cyl, 11:20, NA, NA),
na.rm = FALSE, sigfigs = 4, output = "duplicated_values")
```

fisher_z_transform

Fisher's Z transformation

Description

Perform Fisher's r-to-Z transformation for given correlation coefficient(s).

Usage

```
fisher_z_transform(r = NULL)
```

Arguments

._

a (vector of) correlation coefficient(s)

Value

the output will be a vector of Z values which were transformed from the given r values.

```
fisher_z_transform(0.99)
fisher_z_transform(r = seq(0.1, 0.5, 0.1))
```

floodlight_2_by_continuous

Floodlight 2 by Continuous

Description

Conduct a floodlight analysis for 2 x Continuous design.

Usage

```
floodlight_2_by_continuous(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
 mod_name = NULL,
  covariate_name = NULL,
  interaction_p_include = TRUE,
  iv_level_order = NULL,
  output = "reg_lines_plot",
  jitter_x_y_percent = 0,
  jitter_x_percent = 0,
  jitter_y_percent = 0,
  dot_alpha = 0.5,
  dot_size = 4,
  interaction_p_value_font_size = 8,
  jn_point_label_add = TRUE,
  jn_point_font_size = 8,
  jn_point_label_hjust = NULL,
  lines_at_mod_extremes = FALSE,
  interaction_p_vjust = -3,
  plot_margin = ggplot2::unit(c(75, 7, 7, 7), "pt"),
  legend_position = "right",
  reg_line_types = c("solid", "dashed"),
  jn_line_types = c("solid", "solid"),
  jn_line_thickness = 1.5,
  colors_for_iv = c("red", "blue"),
  sig_region_color = "green",
  sig_region_alpha = 0.08,
  nonsig_region_color = "gray",
  nonsig_region_alpha = 0.08,
  x_axis_title = NULL,
  y_axis_title = NULL,
  legend_title = NULL,
  round_decimals_int_p_value = 3,
  line_of_fit_thickness = 1,
  round_jn_point_labels = 2
)
```

Arguments

data a data object (a data frame or a data.table) name of the binary independent variable iv_name dv_name name of the dependent variable mod_name name of the continuous moderator variable covariate_name name of the variables to control for interaction_p_include logical. Should the plot include a p-value for the interaction term? iv_level_order order of levels in the independent variable for legend. By default, it will be set as levels of the independent variable ordered using R's base function sort. type of output (default = "reg lines plot"). Possible inputs: "interactions pkg results", output "simple_effects_plot", "jn_points", "regions", "reg_lines_plot" jitter_x_y_percent horizontally and vertically jitter dots by a percentage of the respective ranges of x and y values. jitter_x_percent horizontally jitter dots by a percentage of the range of x values jitter_y_percent vertically jitter dots by a percentage of the range of y values opacity of the dots (0 = completely transparent, 1 = completely opaque). By dot_alpha default, dot_alpha = 0.5 dot size size of the dots (default = 4) interaction_p_value_font_size font size for the interaction p value (default = 8) jn_point_label_add logical. Should the labels for Johnson-Neyman point labels be added to the plot? (default = TRUE)jn_point_font_size font size for Johnson-Neyman point labels (default = 8) jn_point_label_hjust a vector of hjust values for Johnson-Neyman point labels. By default, the hjust value will be 0.5 for all the points. lines_at_mod_extremes logical. Should vertical lines be drawn at the observed extreme values of the moderator if those values lie in siginificant region(s)? (default = FALSE) interaction_p_vjust By how much should the label for the interaction p-value be adjusted vertically? By default, interaction_p_vjust = -3) margin for the plot By default plot_margin = ggplot2::unit(c(75, 7, 7, plot_margin 7), "pt") legend_position

position of the legend (default = "right"). If legend_position = "none", the

legend will be removed.

reg_line_types types of the regression lines for the two levels of the independent variable. By default, reg_line_types = c("solid", "dashed")

jn_line_thickness

thickness of the lines at Johnson-Neyman points (default = 1.5)

colors_for_iv colors for the two values of the independent variable (default = c("red", "blue"))
sig_region_color

color of the significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is statistically significant.

sig_region_alpha

opacity for sig_region_color. (0 = completely transparent, 1 = completely opaque). By default, sig_region_alpha = 0.08

nonsig_region_color

color of the non-significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is not statistically significant.

nonsig_region_alpha

opacity for nonsig_region_color. (0 = completely transparent, 1 = completely opaque). By default, nonsig_region_alpha = 0.08

x_axis_title title of the x axis. By default, it will be set as input for mod_name. If x_axis_title = FALSE, it will be removed.

y_axis_title title of the y axis. By default, it will be set as input for dv_name. If y_axis_title = FALSE, it will be removed.

legend_title title of the legend. By default, it will be set as input for iv_name. If legend_title = FALSE, it will be removed.

round_decimals_int_p_value

To how many digits after the decimal point should the p value for the interaction term be rounded? (default = 3)

line_of_fit_thickness

thickness of the lines of fit (default = 1)

round_jn_point_labels

To how many digits after the decimal point should the jn point labels be rounded? (default = 2)

Details

The following package(s) must be installed prior to running this function: Package 'interactions' v1.1.1 (or possibly a higher version) by Jacob A. Long (2020), https://cran.r-project.org/package=interactions See the following references: Spiller et al. (2013) doi:10.1509/jmr.12.0420 Kim (2021) doi:10.5281/zenodo.4445388

Examples

```
# typical example
floodlight_2_by_continuous(
data = mtcars,
iv_name = "am",
dv_name = "mpg",
mod_name = "qsec")
# add covariates
floodlight_2_by_continuous(
data = mtcars,
iv_name = "am"
dv_name = "mpg",
mod_name = "qsec",
covariate_name = c("cyl", "hp"))
# adjust the jn point label positions
floodlight_2_by_continuous(
data = mtcars,
iv_name = "am",
dv_name = "mpg",
mod_name = "qsec",
jn_point_label_hjust = c(1, 0))
# return regions of significance and nonsignificance
floodlight_2_by_continuous(
data = mtcars,
iv_name = "am",
dv_name = "mpg",
mod_name = "qsec",
output = "regions")
# draw lines at the extreme values of the moderator
# if they are included in the significant region
floodlight_2_by_continuous(
data = mtcars,
iv_name = "am";
dv_name = "mpg",
mod_name = "qsec",
lines_at_mod_extremes = TRUE)
#' # remove the labels for jn points
floodlight_2_by_continuous(
data = mtcars,
iv_name = "am",
dv_name = "mpg",
mod_name = "qsec",
jn_point_label_add = FALSE)
```

floodlight_2_by_continuous_logistic

Floodlight 2 by Continuous for a Logistic Regression

Description

Conduct a floodlight analysis for a logistic regression with a 2 x Continuous design involving a binary dependent variable.

Usage

```
floodlight_2_by_continuous_logistic(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
 mod_name = NULL,
  interaction_p_include = TRUE,
  iv_level_order = NULL,
  dv_level_order = NULL,
  jn_points_disregard_threshold = NULL,
  output = "reg_lines_plot",
  num_of_spotlights = 20,
  jitter_x_percent = 0,
  jitter_y_percent = 5,
  dot_alpha = 0.3,
  dot_size = 6,
  interaction_p_value_font_size = 8,
  jn_point_font_size = 8,
  jn_point_label_hjust = NULL,
  interaction_p_vjust = -3,
  plot_margin = ggplot2::unit(c(75, 7, 7, 7), "pt"),
  legend_position = "right",
  line_types_for_pred_values = c("solid", "dashed"),
  line_thickness_for_pred_values = 2.5,
  jn_line_types = c("solid", "solid"),
  jn_line_thickness = 1.5,
  sig_region_color = "green",
  sig_region_alpha = 0.08,
  nonsig_region_color = "gray",
  nonsig_region_alpha = 0.08,
  x_axis_title = NULL,
  y_axis_title = NULL,
  legend_title = NULL,
  round_decimals_int_p_value = 3,
  round_jn_point_labels = 2
)
```

Arguments

```
data a data object (a data frame or a data.table)

iv_name name of the binary independent variable

dv_name name of the binary dependent variable

mod_name name of the continuous moderator variable
```

interaction_p_include

logical. Should the plot include a p-value for the interaction term?

iv_level_order order of levels in the independent variable for legend. By default, it will be set as levels of the independent variable ordered using R's base function sort.

dv_level_order order of levels in the dependent variable. By default, it will be set as levels of the dependent variable ordered using R's base function sort.

jn_points_disregard_threshold

the Minimum Distance in the unit of the moderator variable that will be used for various purposes, such as (1) to disregard the second Johnson-Neyman point that is different from the first Johnson-Neyman (JN) point by less than the Minimum Distance; (2) to determine regions of significance, which will calculate the pvalue of the IV's effect (the focal dummy variable's effect) on DV at a candidate JN point + / - the Minimum Distance. This input is hard to explain, but a user can enter a really low value for this argument (e.g., jn_points_disregard_threshold = 0.1 for a moderator measured on a 100-point scale) or use the default. By default, jn_points_disregard_threshold = range of the moderator / 10000 For example, if the observed moderator values range from 1 to 7 (because it is a 7-point scale), then jn_points_disregard_threshold = (7 - 1) / 10000 = 0.0006

output

type of output (default = "reg_lines_plot"). Possible inputs: "interactions_pkg_results", "simple_effects_plot", "jn_points", "regions", "reg_lines_plot"

num_of_spotlights

How many spotlight analyses should be conducted to plot the predicted values at various values of the moderator? (default = 20)

jitter_x_percent

horizontally jitter dots by a percentage of the range of x values (default = 0)

jitter_y_percent

vertically jitter dots by a percentage of the range of y values (default = 5)

dot_alpha

opacity of the dots (0 = completely transparent, 1 = completely opaque). By default, dot_alpha = 0.3

size of the dots (default = 6) dot_size

interaction_p_value_font_size

font size for the interaction p value (default = 8)

jn_point_font_size

font size for Johnson-Neyman point labels (default = 8) jn_point_label_hjust

a vector of hjust values for Johnson-Neyman point labels. By default, the hjust value will be 0.5 for all the points.

interaction_p_vjust

By how much should the label for the interaction p-value be adjusted vertically? By default, interaction_p_vjust = -3)

plot_margin margin for the plot By default plot_margin = ggplot2::unit(c(75, 7, 7, 7), "pt")

legend_position

position of the legend (default = "right"). If legend_position = "none", the legend will be removed.

line_types_for_pred_values

types of the lines for plotting the predicted values By default, line_types_for_pred_values = c("solid", "dashed")

line_thickness_for_pred_values

thickness of the lines for plotting the predicted values (default = 2.5)

jn_line_thickness

thickness of the lines at Johnson-Neyman points (default = 1.5)

sig_region_color

color of the significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is statistically significant.

sig_region_alpha

opacity for sig_region_color. (0 = completely transparent, 1 = completely opaque). By default, sig_region_alpha = 0.08

nonsig_region_color

color of the non-significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is not statistically significant.

nonsig_region_alpha

opacity for nonsig_region_color. (0 = completely transparent, 1 = completely opaque). By default, nonsig_region_alpha = 0.08

x_axis_title title of the x axis. By default, it will be set as input for mod_name. If x_axis_title = FALSE, it will be removed.

y_axis_title title of the y axis. By default, it will be set as input for dv_name. If y_axis_title = FALSE, it will be removed.

legend_title title of the legend. By default, it will be set as input for iv_name. If legend_title = FALSE, it will be removed.

round_decimals_int_p_value

To how many digits after the decimal point should the p value for the interaction term be rounded? (default = 3)

round_jn_point_labels

To how many digits after the decimal point should the jn point labels be rounded? (default = 2)

  y_axis_title = NULL,
  legend_title = NULL,
  round_decimals_int_p_value = 3,
  round_jn_point_labels = 2
)
```

Arguments

data a data object (a data frame or a data.table) iv_name name of the binary independent variable dv_name name of the binary dependent variable mod_name name of the continuous moderator variable interaction_p_include

logical. Should the plot include a p-value for the interaction term?

iv_level_order order of levels in the independent variable for legend. By default, it will be set as levels of the independent variable ordered using R's base function sort.

dv_level_order order of levels in the dependent variable. By default, it will be set as levels of the dependent variable ordered using R's base function sort.

jn_points_disregard_threshold

the Minimum Distance in the unit of the moderator variable that will be used for various purposes, such as (1) to disregard the second Johnson-Neyman point that is different from the first Johnson-Neyman (JN) point by less than the Minimum Distance; (2) to determine regions of significance, which will calculate the pvalue of the IV's effect (the focal dummy variable's effect) on DV at a candidate JN point + / - the Minimum Distance. This input is hard to explain, but a user can enter a really low value for this argument (e.g., jn_points_disregard_threshold = 0.1 for a moderator measured on a 100-point scale) or use the default. By default, jn_points_disregard_threshold = range of the moderator / 10000 For example, if the observed moderator values range from 1 to 7 (because it is a 7-point scale), then jn_points_disregard_threshold = (7 - 1) / 10000 = 0.0006

output

type of output (default = "reg_lines_plot"). Possible inputs: "interactions_pkg_results", "simple_effects_plot", "jn_points", "regions", "reg_lines_plot"

num_of_spotlights

How many spotlight analyses should be conducted to plot the predicted values at various values of the moderator? (default = 20)

jitter_x_percent

horizontally jitter dots by a percentage of the range of x values (default = 0)

jitter_y_percent

vertically jitter dots by a percentage of the range of y values (default = 5)

dot_alpha opacity of the dots (0 = completely transparent, 1 = completely opaque). By $default, dot_alpha = 0.3$ size of the dots (default = 6) dot size interaction_p_value_font_size font size for the interaction p value (default = 8) jn_point_font_size font size for Johnson-Neyman point labels (default = 8) jn_point_label_hjust a vector of hjust values for Johnson-Neyman point labels. By default, the hjust value will be 0.5 for all the points. interaction_p_vjust By how much should the label for the interaction p-value be adjusted vertically? By default, interaction_p_vjust = -3) plot_margin margin for the plot By default plot_margin = ggplot2::unit(c(75, 7, 7, 7), "pt") legend_position position of the legend (default = "right"). If legend_position = "none", the legend will be removed. line_types_for_pred_values types of the lines for plotting the predicted values By default, line_types_for_pred_values = c("solid", "dashed") line_thickness_for_pred_values thickness of the lines for plotting the predicted values (default = 2.5) types of the lines for Johnson-Neyman points. By default, jn_line_types = jn_line_types c("solid", "solid") jn_line_thickness thickness of the lines at Johnson-Neyman points (default = 1.5) sig_region_color color of the significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is statistically significant. sig_region_alpha opacity for sig_region_color . (0 = completely transparent, 1 = completely opaque). By default, sig_region_alpha = 0.08 nonsig_region_color color of the non-significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is not statistically significant. nonsig_region_alpha opacity for nonsig_region_color. (0 = completely transparent, 1 = completely opaque). By default, nonsig_region_alpha = 0.08 title of the x axis. By default, it will be set as input for mod_name. If x_axis_title x_axis_title = FALSE, it will be removed. y_axis_title title of the y axis. By default, it will be set as input for dv_name. If y_axis_title = FALSE, it will be removed.

Examples

```
floodlight_2_by_continuous_logistic(
data = mtcars,
iv_name = "am",
dv_name = "vs",
mod_name = "mpg")
# adjust the number of spotlights
# (i.e., predict values at only 4 values of the moderator)
floodlight_2_by_continuous_logistic(
data = mtcars,
iv_name = "am",
dv_name = "vs",
mod_name = "mpg",
num_of_spotlights = 4)
```

floodlight_for_contrasts

Floodlight Analyses for a Set of Contrasts

Description

Conduct a floodlight analysis for a set of contrasts with a continuous moderator variable.

Usage

```
floodlight_for_contrasts(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  mod_name = NULL,
  contrasts = NULL,
```

```
contrasts_for_floodlight = NULL,
covariate_name = NULL,
interaction_p_include = TRUE,
iv_category_order = NULL,
heteroskedasticity_consistent_se = "HC4",
round_r_squared = 3,
round_f = 2,
sigfigs = 2,
jn_points_disregard_threshold = NULL,
print_floodlight_plots = TRUE,
output = "reg_lines_plot",
jitter_x_percent = 0,
jitter_y_percent = 0,
dot_alpha = 0.5,
dot_size = 4,
interaction_p_value_font_size = 6,
jn_point_font_size = 6,
jn_point_label_hjust = NULL,
interaction_p_vjust = -3,
plot_margin = ggplot2::unit(c(75, 7, 7, 7), "pt"),
legend_position = "right",
line_of_fit_types = c("solid", "dashed"),
line_of_fit_thickness = 1.5,
jn_line_types = c("solid", "solid"),
jn_line_thickness = 1.5,
sig_region_color = "green",
sig_region_alpha = 0.08,
nonsig_region_color = "gray",
nonsig_region_alpha = 0.08,
x_axis_title = NULL,
y_axis_title = NULL,
legend_title = NULL,
round_decimals_int_p_value = 3,
round_jn_point_labels = 2
```

Arguments

```
data a data object (a data frame or a data.table)

iv_name name of the multicategorical independent variable; this variable must have three or more categories.

dv_name name of the dependent variable

mod_name name of the continuous moderator variable

contrasts names of the contrast variables

contrasts_for_floodlight

names of the contrast variables for which floodlight analyses will be conducted

covariate_name name of the variables to control for
```

interaction_p_include

logical. Should the plot include a p-value for the interaction term?

iv_category_order

order of levels in the independent variable for legend. By default, it will be set as levels of the independent variable ordered using R's base function sort.

heteroskedasticity_consistent_se

which kind of heteroskedasticity-consistent (robust) standard errors should be calculated? (default = "HC4")

round_r_squared

number of decimal places to which to round r-squared values (default = 3)

round_f number of decimal places to which to round the f statistic for model comparison

(default = 2)

sigfigs number of significant digits to round to (for values in the regression tables, ex-

cept for p values). By default sigfigs = 2

jn_points_disregard_threshold

the Minimum Distance in the unit of the moderator variable that will be used for various purposes, such as (1) to disregard the second Johnson-Neyman point that is different from the first Johnson-Neyman (JN) point by less than the Minimum Distance; (2) to determine regions of significance, which will calculate the p-value of the IV's effect (the focal dummy variable's effect) on DV at a candidate JN point + / - the Minimum Distance. This input is hard to explain, but a user can enter a really low value for this argument (e.g., jn_points_disregard_threshold = 0.1 for a moderator measured on a 100-point scale) or use the default. By default, jn_points_disregard_threshold = range of the moderator / 10000 For example, if the observed moderator values range from 1 to 7 (because it is a 7-point scale), then jn_points_disregard_threshold = (7 - 1) / 10000 = 0.0006

print_floodlight_plots

If print_floodlight_plots = TRUE, a floodlight plot for each dummy variable will be printed. By default, print_floodlight_plots = TRUE

output of the function (default = "all"). Possible inputs: "reg_models", "reg_tables", "reg_tables_rounded", "all"

jitter_x_percent

horizontally jitter dots by a percentage of the range of x values

jitter_y_percent

vertically jitter dots by a percentage of the range of y values

 dot_alpha opacity of the dots (0 = completely transparent, 1 = completely opaque). By

default, dot_alpha = 0.5

 dot_size size of the dots (default = 4)

 $interaction_p_value_font_size$

font size for the interaction p value (default = 8)

jn_point_font_size

font size for Johnson-Neyman point labels (default = 6)

jn_point_label_hjust

a vector of hjust values for Johnson-Neyman point labels. By default, the hjust value will be 0.5 for all the points.

interaction_p_vjust

By how much should the label for the interaction p-value be adjusted vertically? By default, $interaction_pvjust = -3$)

plot_margin

margin for the plot By default plot_margin = ggplot2::unit(c(75, 7, 7, 7), "pt")

legend_position

position of the legend (default = "right"). If legend_position = "none", the legend will be removed.

line_of_fit_types

types of the lines of fit for the two levels of the independent variable. By default, $line_of_fit_types = c("solid", "dashed")$

line_of_fit_thickness

thickness of the lines of fit (default = 1.5)

jn_line_thickness

thickness of the lines at Johnson-Neyman points (default = 1.5)

sig_region_color

color of the significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is statistically significant.

sig_region_alpha

opacity for sig_region_color. (0 = completely transparent, 1 = completely opaque). By default, sig_region_alpha = 0.08

nonsig_region_color

color of the non-significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is not statistically significant.

nonsig_region_alpha

opacity for nonsig_region_color. (0 = completely transparent, 1 = completely opaque). By default, nonsig_region_alpha = 0.08

x_axis_title title of the x axis. By default, it will be set as input for mod_name. If x_axis_title = FALSE, it will be removed.

y_axis_title title of the y axis. By default, it will be set as input for dv_name. If y_axis_title = FALSE, it will be removed.

legend_title title of the legend. By default, it will be set as input for iv_name. If legend_title = FALSE, it will be removed.

round_decimals_int_p_value

To how many digits after the decimal point should the p value for the interaction term be rounded? (default = 3)

round_jn_point_labels

To how many digits after the decimal point should the jn point labels be rounded? (default = 2)

Details

legend_title = NULL,
round_decimals_int_p_value = 3,
round_jn_point_labels = 2
```

Arguments

)

data a data object (a data frame or a data.table)

iv_name name of the multicategorical independent variable; this variable must have three

or more categories.

dv_name name of the dependent variable

mod_name name of the continuous moderator variable

coding name of the coding scheme to use; the current version of the function allows

only the "indicator" coding scheme. By default, coding = "indicator"

baseline_category

value of the independent variable that will be the reference value against which

other values of the independent variable will be compared

covariate_name name of the variables to control for

interaction_p_include

logical. Should the plot include a p-value for the interaction term?

iv_category_order

order of levels in the independent variable for legend. By default, it will be set as levels of the independent variable ordered using R's base function sort.

heteroskedasticity_consistent_se

which kind of heteroskedasticity-consistent (robust) standard errors should be calculated? (default = "HC4")

round_r_squared

number of decimal places to which to round r-squared values (default = 3)

round_f number of decimal places to which to round the f statistic for model comparison (default = 2)

sigfigs number of significant digits to round to (for values in the regression tables, except for p values). By default sigfigs = 2

jn_points_disregard_threshold

the Minimum Distance in the unit of the moderator variable that will be used for various purposes, such as (1) to disregard the second Johnson-Neyman point that is different from the first Johnson-Neyman (JN) point by less than the Minimum Distance; (2) to determine regions of significance, which will calculate the p-value of the IV's effect (the focal dummy variable's effect) on DV at a candidate JN point + / - the Minimum Distance. This input is hard to explain, but a user can enter a really low value for this argument (e.g., jn_points_disregard_threshold = 0.1 for a moderator measured on a 100-point scale) or use the default. By default, jn_points_disregard_threshold = range of the moderator / 10000 For example, if the observed moderator values range from 1 to 7 (because it is a 7-point scale), then jn_points_disregard_threshold = (7 - 1) / 10000 = 0.0006

print_floodlight_plots

If print_floodlight_plots = TRUE, a floodlight plot for each dummy variable will be printed. By default, print_floodlight_plots = TRUE

output of the function (default = "all"). Possible inputs: "reg_models", "reg_tables", "reg_tables", "all"

jitter_x_percent

horizontally jitter dots by a percentage of the range of x values

jitter_y_percent

vertically jitter dots by a percentage of the range of y values

dot_alpha opacity of the dots (0 = completely transparent, 1 = completely opaque). By default, dot_alpha = 0.5

 dot_size size of the dots (default = 4)

interaction_p_value_font_size

font size for the interaction p value (default = 8)

jn_point_font_size

font size for Johnson-Neyman point labels (default = 8)

jn_point_label_hjust

a vector of hjust values for Johnson-Neyman point labels. By default, the hjust value will be 0.5 for all the points.

interaction_p_vjust

By how much should the label for the interaction p-value be adjusted vertically? By default, interaction_p_vjust = -3)

plot_margin margin for the plot By default plot_margin = ggplot2::unit(c(75, 7, 7, 7), "pt")

legend_position

position of the legend (default = "right"). If legend_position = "none", the legend will be removed.

line_of_fit_types

types of the lines of fit for the two levels of the independent variable. By default, $line_of_fit_types = c("solid", "dashed")$

line_of_fit_thickness

thickness of the lines of fit (default = 1.5)

jn_line_thickness

thickness of the lines at Johnson-Neyman points (default = 1.5)

 $colors_for_iv \quad colors \ for \ the \ two \ values \ of \ the \ independent \ variable \ (default = c("red", "blue")) \\ sig_region_color$

color of the significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is statistically significant.

sig_region_alpha

opacity for sig_region_color. (0 = completely transparent, 1 = completely opaque). By default, sig_region_alpha = 0.08

nonsig_region_color

color of the non-significant region, i.e., range(s) of the moderator variable for which simple effect of the independent variable on the dependent variable is not statistically significant.

nonsig_region_alpha

opacity for nonsig_region_color. (0 = completely transparent, 1 = completely opaque). By default, nonsig_region_alpha = 0.08

x_axis_title title of the x axis. By default, it will be set as input for mod_name. If x_axis_title = FALSE, it will be removed.

y_axis_title title of the y axis. By default, it will be set as input for dv_name. If y_axis_title = FALSE, it will be removed.

legend_title title of the legend. By default, it will be set as input for iv_name. If legend_title = FALSE, it will be removed.

round_decimals_int_p_value

To how many digits after the decimal point should the p value for the interaction term be rounded? (default = 3)

round_jn_point_labels

To how many digits after the decimal point should the jn point labels be rounded? (default = 2)

```

geomean

Geometric mean

Description

Calculate the geometric mean of a numeric vector

Usage

```
geomean(x = NULL, zero_or_neg_convert_to = NA)
```

Arguments

```
x a numeric vector

zero_or_neg_convert_to

the value to which zero or negative values will be converted to. If zero_or_neg_convert_to

== NA, zero or negative values will be converted to NA values and thus be excluded when calculating the geometric mean. (default = NA)
```

```
## Not run:
geomean(c(1, 4))
geomean(c(1, 100))
geomean(c(1, 100, NA))
geomean(c(1, 100, NA, 0, -1, -2))
geomean(
x = c(1, 100, NA, 0, -1, -2),

geomean(c(1, 100, NA, 1, 1, 1))
## End(Not run)
```

66 ggsave_quick

ggsave_quick

ggsave quick

Description

quickly save the current plot with a timestamp

Usage

```
ggsave_quick(
 name = NULL,
 file_name_extension = "png",
 timestamp = NULL,
 width = 16,
 height = 9
)
```

Arguments

name

a character string of the png file name. By default, if no input is given (name = NULL), the file name will begin with "ggplot". If the desired output file name is "myplot.png", enter name = "myplot", timestamp = FALSE

file_name_extension

file name extension (default = "png"). If file_name_extension = "svg", Pack-

age syglite needs to be installed.

timestamp

if timestamp = TRUE, a timestamp of the current time will be appended to the file name. The timestamp will be in the format, jan_01_2021_1300_10_000001, where "jan_01_2021" would indicate January 01, 2021; 1300 would indicate 13:00 (i.e., 1 PM); and 10 000001 would indicate 10.000001 seconds after the hour. By default, timestamp will be set as TRUE, if no input is given for the name argument, and as FALSE, if an input is given for the name argument.

width

height

width of the plot to be saved. This argument will be directly entered as the width argument for the ggsave function within ggplot2 package (default = 16)

height of the plot to be saved. This argument will be directly entered as the height argument for the ggsave function within ggplot2 package (default = 9)

Value

the output will be a .png image file in the working directory.

```
## Not run:
kim::histogram(rep(1:30, 3))
ggsave_quick()
## End(Not run)
```

histogram 67

histogram	Histogram
-----------	-----------

Description

Create a histogram based on the output of the hist function in the graphics package.

Usage

```
histogram(
  vector = NULL,
 breaks = NULL,
  counts = NULL,
  percent = FALSE,
  bin_fill_color = "green4",
  bin_border_color = "black",
  bin_border_thickness = 1,
  notify_na_count = NULL,
  x_axis_tick_marks = NULL,
  y_axis_tick_marks = NULL,
  cap_axis_lines = TRUE,
  x_axis_title = "Value",
 y_axis_title = NULL,
 y_axis_title_vjust = 0.85
)
```

Arguments

```
vector
                  a numeric vector
breaks
                  a numeric vector indicating breaks for the bins. By default, no input is required
                  for this argument.
                  a numeric vector containing counts for the bins (i.e., heights of the bins). By
counts
                  default, no input is required for this argument.
                  logical. If percent = TRUE, percentages will be plotted rather than frequencies
percent
                  (default = FALSE).
bin_fill_color color of the area inside each bin (default = "green4")
bin_border_color
                  color of the border around each bin (default = "black")
bin_border_thickness
                  thickness of the border around each bin (default = 1)
notify_na_count
                  if TRUE, notify how many observations were removed due to missing values. By
                  default, NA count will be printed only if there are any NA values.
x_axis_tick_marks
                  a vector of values at which to place tick marks on the x axis (e.g., setting
                  x_axis_tick_marks = seq(0, 10, 5) will put tick marks at 0, 5, and 10.)
```

histogram_by_group

Value

the output will be a histogram, a ggplot object.

Examples

```
histogram(1:100)
histogram(c(1:100, NA))
histogram(vector = mtcars[["mpg"]])
histogram(vector = mtcars[["mpg"]], percent = TRUE)
histogram(vector = mtcars[["mpg"]],
x_axis_tick_marks = c(10, 25, 35), y_axis_title_vjust = 0.5,
y_axis_title = "Freq", x_axis_title = "Values of mpg")
```

histogram_by_group

Histogram by group

Description

Creates histograms by group to compare distributions.

Usage

```
histogram_by_group(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  order_of_groups_top_to_bot = NULL,
  number_of_bins = 40,
  space_between_histograms = 0.15,
  draw_baseline = FALSE,
  xlab = NULL,
  ylab = NULL,
  x_limits = NULL,
```

histogram_by_group 69

```
x_breaks = NULL,
x_labels = NULL,
sigfigs = 3,
convert_dv_to_numeric = TRUE)
```

Arguments

data a data object (a data frame or a data.table)

iv_namename of the independent variabledv_namename of the dependent variable

order_of_groups_top_to_bot

a character vector indicating the desired presentation order of levels in the independent variable (from the top to bottom). Omitting a group in this argument

will remove the group in the set of histograms.

number_of_bins number of bins for the histograms (default = 40)

space_between_histograms

space between histograms (minimum = 0, maximum = 1, default = 0.15)

draw_baseline logical. Should the baseline and the trailing lines to either side of the histogram

be drawn? (default = FALSE)

xlab title of the x-axis for the histogram by group. If xlab = FALSE, the title will be

removed. By default (i.e., if no input is given), dv_name will be used as the title.

ylab title of the y-axis for the histogram by group. If ylab = FALSE, the title will be

removed. By default (i.e., if no input is given), iv_name will be used as the title.

x_limits a numeric vector with values of the endpoints of the x axis.

x_breaks a numeric vector indicating the points at which to place tick marks on the x axis.

x_labels a vector containing labels for the place tick marks on the x axis.

sigfigs number of significant digits to round to (default = 3)

convert_dv_to_numeric

logical. Should the values in the dependent variable be converted to numeric for

plotting the histograms? (default = TRUE)

Details

The following package(s) must be installed prior to running this function: Package 'ggridges' v0.5.3 (or possibly a higher version) by Claus O. Wilke (2021), https://cran.r-project.org/package=ggridges

Value

the output will be a set of vertically arranged histograms (a ggplot object), i.e., one histogram for each level of the independent variable.

Examples

```
histogram_by_group(data = mtcars, iv_name = "cyl", dv_name = "mpg")
histogram_by_group(
  data = mtcars, iv_name = "cyl", dv_name = "mpg",
  order_of_groups_top_to_bot = c("8", "4"), number_of_bins = 10,
  space_between_histograms = 0.5
)
histogram_by_group(
data = iris, iv_name = "Species", dv_name = "Sepal.Length", x_breaks = 4:8,
x_limits = c(4, 8))
```

histogram_deprecated_1

Histogram

Description

Create a histogram

Usage

```
histogram_deprecated_1(
  vector = NULL,
  number_of_bins = 30,
  x_tick_marks = NULL,
  y_tick_marks = NULL,
  fill_color = "cyan4",
  border_color = "black",
  y_axis_title_vjust = 0.85,
  x_axis_title = NULL,
  y_axis_title = NULL,
  cap_axis_lines = FALSE,
  notify_na_count = NULL)
```

Arguments

```
vector a numeric vector
number_of_bins number of bins for the histogram (default = 30)
x_tick_marks a vector of values at which to place tick marks on the x axis (e.g., setting x_tick_marks = seq(0, 10, 5) will put tick marks at 0, 5, and 10.)
y_tick_marks a vector of values at which to place tick marks on the y axis (e.g., setting y_tick_marks = seq(0, 10, 5) will put tick marks at 0, 5, and 10.)
fill_color color for inside of the bins (default = "cyan4")
```

histogram_from_hist 71

```
border_color color for borders of the bins (default = "black")

y_axis_title_vjust

position of the y axis title (default = 0.85).

x_axis_title title for x axis (default = "Value")

y_axis_title title for y axis (default = "Count")

cap_axis_lines logical. Should the axis lines be capped at the outer tick marks? (default = FALSE)

notify_na_count

if TRUE, notify how many observations were removed due to missing values. By default, NA count will be printed only if there are any NA values.
```

Value

the output will be a histogram, a ggplot object.

Examples

```
histogram_deprecated_1(1:100)
histogram_deprecated_1(c(1:100, NA))
histogram_deprecated_1(vector = mtcars[["mpg"]])
histogram_deprecated_1(
vector = mtcars[["mpg"]], x_tick_marks = seq(10, 36, 2))
histogram_deprecated_1(
vector = mtcars[["mpg"]], x_tick_marks = seq(10, 36, 2),
y_tick_marks = seq(0, 8, 2), y_axis_title_vjust = 0.5,
y_axis_title = "Freq", x_axis_title = "Values of mpg")
```

histogram_from_hist Histogram from hist function

Description

Create a histogram based on the output of the hist function in the graphics package.

Usage

```
histogram_from_hist(
  vector = NULL,
  breaks = NULL,
  counts = NULL,
  percent = FALSE,
  bin_fill_color = "green4",
  bin_border_color = "black",
  bin_border_thickness = 1,
  notify_na_count = NULL,
```

72 histogram_from_hist

```
x_axis_tick_marks = NULL,
y_axis_tick_marks = NULL,
cap_axis_lines = TRUE,
x_axis_title = "Value",
y_axis_title = NULL,
y_axis_title_vjust = 0.85
```

Arguments

vector a numeric vector breaks a numeric vector indicating breaks for the bins. By default, no input is required for this argument. a numeric vector containing counts for the bins (i.e., heights of the bins). By counts default, no input is required for this argument. logical. If percent = TRUE, percentages will be plotted rather than frequencies percent (default = FALSE).bin_fill_color color of the area inside each bin (default = "green4") bin_border_color color of the border around each bin (default = "black") bin_border_thickness thickness of the border around each bin (default = 1) notify_na_count if TRUE, notify how many observations were removed due to missing values. By default, NA count will be printed only if there are any NA values. x_axis_tick_marks a vector of values at which to place tick marks on the x axis (e.g., setting $x_axis_tick_marks = seq(0, 10, 5)$ will put tick marks at 0, 5, and 10.) y_axis_tick_marks a vector of values at which to place tick marks on the y axis (e.g., setting $y_axis_tick_marks = seq(0, 10, 5)$ will put tick marks at 0, 5, and 10.) cap_axis_lines logical. Should the axis lines be capped at the outer tick marks? (default = FALSE) x_axis_title title for x axis (default = "Value") title for y axis (default = "Count" or "Percentage", depending on the value of y_axis_title percent) y_axis_title_vjust position of the y axis title (default = 0.85).

Value

the output will be a histogram, a ggplot object.

Examples

```
histogram_from_hist(1:100)
histogram_from_hist(c(1:100, NA))
histogram_from_hist(vector = mtcars[["mpg"]])
histogram_from_hist(vector = mtcars[["mpg"]], percent = TRUE)
histogram_from_hist(vector = mtcars[["mpg"]],
x_axis_tick_marks = c(10, 25, 35), y_axis_title_vjust = 0.5,
y_axis_title = "Freq", x_axis_title = "Values of mpg")
```

histogram_w_outlier_bins

Histogram with outlier bins

Description

Create a histogram with outlier bins

```
histogram_w_outlier_bins(
  vector = NULL,
  bin_cutoffs = NULL,
  outlier_bin_left = TRUE,
  outlier_bin_right = TRUE,
  x_tick_marks = NULL,
  x_tick_mark_labels = NULL,
 y_tick_marks = NULL,
 outlier_bin_fill_color = "coral",
  non_outlier_bin_fill_color = "cyan4",
  border_color = "black",
 y_axis_title_vjust = 0.85,
  x_axis_title = NULL,
  y_axis_title = NULL,
  notify_na_count = NULL,
  plot_proportion = TRUE,
  plot_frequency = FALSE,
 mean = TRUE,
  ci = TRUE,
 median = TRUE,
 median_position = 15,
  error_bar_size = 3
)
```

Arguments

vector a numeric vector bin_cutoffs cutoff points for bins

outlier_bin_left

logical. Should the leftmost bin treated as an outlier bin? (default = TRUE)

outlier_bin_right

logical. Should the rightmost bin treated as an outlier bin? (default = TRUE)

x_tick_marks a vector of values at which to place tick marks on the x axis. Note that the first

bar spans from 0.5 to 1.5, second bar from 1.5 to 2.5, ... nth bar from n - 0.5 to n + 0.5. See the example. By default, tick marks will be placed at every cutoff

point for bins

x_tick_mark_labels

a character vector to label tick marks. By default, the vector of cutoff points for

bins will also be used as labels.

y_tick_marks a vector of values at which to place tick marks on the y axis (e.g., setting $y_tick_marks = seq(0, 10, 5)$ will put tick marks at 0, 5, and 10.)

outlier_bin_fill_color

color to fill inside of the outlier bins (default = "coral")

non_outlier_bin_fill_color

color to fill inside of the non-outlier bins (default = "cyan4")

border_color color for borders of the bins (default = "black")

y_axis_title_vjust

position of the y axis title (default = 0.85).

 x_axis_title title for x axis (default = "Value"). If x_axis_title = FALSE, x axis title will be

removed from the plot.

y_axis_title title for y axis. By default, it will be either "Proportion" or "Count".

notify_na_count

if TRUE, notify how many observations were removed due to missing values. By default, NA count will be printed only if there are any NA values.

plot_proportion

logical. Should proportions be plotted, as opposed to frequencies? (default = TRUE)

plot_frequency logic

logical. Should frequencies be plotted, as opposed to proportions? (default = FALSE). If plot_frequency = TRUE, plot_proportion will switch to be

FALSE.

mean logical. Should mean marked on the histogram? (default = TRUE)

ci logical. Should 95% confidence interval marked on the histogram? (default =

TRUE)

median logical. Should median marked on the histogram? (default = TRUE)

median_position

position of the median label as a percentage of height of the tallest bin (default = 15)

error_bar_size size of the error bars (default = 3)

holm_adjusted_p 75

Value

a ggplot object

Examples

```
histogram_w_outlier_bins(vector = 1:100, bin_cutoffs = seq(0, 100, 10)) histogram_w_outlier_bins(vector = 0:89, bin_cutoffs = seq(0, 90, 10), x_tick_marks = seq(0.5, 9.5, 3), x_tick_mark_labels = seq(0, 90, 30)) histogram_w_outlier_bins(vector = 1:10, bin_cutoffs = seq(0, 10, 2.5)) histogram_w_outlier_bins(vector = 1:5, bin_cutoffs = seq(0, 10, 2.5)) histogram_w_outlier_bins(vector = 1:15, bin_cutoffs = c(5.52, 10.5))
```

holm_adjusted_p

Holm-adjusted p-values

Description

Adjust a vector of p-values using the method proposed by Holm

Usage

```
holm_adjusted_p(p = NULL)
```

Arguments

р

a numeric vector of p-values

Details

See the following reference: Holm 1979 https://www.jstor.org/stable/4615733 Manual for the 'p.adjust' function in the 'stats' package https://stat.ethz.ch/R-manual/R-devel/library/stats/html/p.adjust.html

```
holm_adjusted_p(c(.05, .01))
holm_adjusted_p(c(.05, .05, .05))
```

76 id_across_datasets

identical_all

Check whether all inputs are identical

Description

Check whether all inputs are identical

Usage

```
identical_all(...)
```

Arguments

... two or more R objects. If a vector or list is entered as an input, the function will test whether the vector's or list's elements are identical.

Value

the output will be TRUE if all inputs are identical or FALSE if not

Examples

```
identical_all(1:3, 1:3) # should return TRUE
identical_all(1:3, 1:3, 1:3, 1:3, 1:3) # should return TRUE
identical_all(1:3, 1:3, 1:3, 1:3, 1:4) # should return FALSE
identical_all(1:10) # should return FALSE
identical_all(rep(1, 100)) # should return TRUE
identical_all(list(1, 1, 1)) # should return TRUE
identical_all(TRUE, FALSE) # should return FALSE
identical_all(FALSE, TRUE) # should return FALSE
```

id_across_datasets

ID across datasets

Description

Create an ID column in each of the data sets. The ID values will span across the data sets.

```
id_across_datasets(
  dt_list = NULL,
  id_col_name = "id",
  id_col_position = "first",
  silent = FALSE
)
```

Arguments

dt_list a list of data.table objects

id_col_name name of the column that will contain ID values. By default, id_col_name =

"id".

id_col_position

position of the newly created ID column. If id_col_position = "first", the new ID column will be placed as the first column in respective data sets. If id_col_position = "last", the new ID column will be placed as the last col-

umn in respective data sets.

silent If silent = TRUE, a summary of starting and ending ID values in each data set

will not be printed. If silent = FALSE, a summary of starting and ending ID

values in each data set will be printed. (default = FALSE)

Value

the output will be a list of data.table objects.

Examples

```
# running the examples below requires importing the data.table package.
prep(data.table)
id_across_datasets(
dt_list = list(setDT(copy(mtcars)), setDT(copy(iris))))
id_across_datasets(
dt_list = list(setDT(copy(mtcars)), setDT(copy(iris)), setDT(copy(women))),
id_col_name = "newly_created_id_col",
id_col_position = "last")
```

install_all_dependencies

Install all dependencies for all functions

Description

Install all dependencies for all functions in Package 'kim'.

Usage

```
install_all_dependencies()
```

Value

there will be no output from this function. Rather, dependencies of all functions in Package 'kim' will be installed.

78 kurtosis

Examples

```
## Not run:
install_all_dependencies()
## End(Not run)
```

kurtosis

Kurtosis

Description

Calculate kurtosis of the sample using a formula for either the (1) biased estimator or (2) an unbiased estimator of the population kurtosis. Formulas were taken from DeCarlo (1997), doi:10.1037/1082-989X.2.3.292

Usage

```
kurtosis(vector = NULL, unbiased = TRUE)
```

Arguments

vector a numeric vector

unbiased logical. If unbiased = TRUE, the unbiased estimate of the population kurtosis

will be calculated. If unbiased = FALSE, the biased estimate of the population

kurtosis will be calculated. By default, unbiase = TRUE.

Value

a numeric value, i.e., kurtosis of the given vector

```
# calculate the unbiased estimator (e.g., kurtosis value that
# Excel 2016 will produce)
kim::kurtosis(c(1, 2, 3, 4, 5, 10))
# calculate the biased estimator (e.g., kurtosis value that
# R Package 'moments' will produce)
kim::kurtosis(c(1, 2, 3, 4, 5, 10), unbiased = FALSE)
# compare with kurtosis from 'moments' package
moments::kurtosis(c(1, 2, 3, 4, 5, 10))
```

lenu 79

lenu

lenu: Length of unique values

Description

Extract unique elements and get the length of those elements

Usage

```
lenu(x = NULL)
```

Arguments

Χ

a vector or a data frame or an array or NULL.

Value

a vector, data frame, or array-like 'x' but with duplicate elements/rows removed.

Examples

```
unique(c(10, 3, 7, 10))
lenu(c(10, 3, 7, 10))
unique(c(10, 3, 7, 10, NA))
lenu(c(10, 3, 7, 10, NA))
lenu(c("b", "z", "b", "a", NA, NA, NA))
```

levene_test

Levene's test

Description

Conduct Levene's test (i.e., test the null hypothesis that the variances in different gorups are equal)

```
levene_test(
  data = NULL,
  dv_name = NULL,
  iv_1_name = NULL,
  iv_2_name = NULL,
  round_f = 2,
  round_p = 3,
  output_type = "text"
)
```

80 logistic_regression

Arguments

data a data object (a data frame or a data.table) dv name name of the dependent variable name of the first independent variable iv_1_name iv_2_name name of the second independent variable round_f number of decimal places to which to round the F-statistic from Levene's test (default = 2)round_p number of decimal places to which to round the p-value from Levene's test (default = 3If output_type = "text", the output will be the results of Levene's test in a text output_type format (i.e., character). If output_type = "list", the output will be the results of Levene's test in a list format (e.g., p value, F stat, etc. as a list). By default,

Value

the output of the function depends on the input for output_type. By default, the output will be the results of Levene's test in a text format (i.e., character).

Examples

```
## Not run:
levene_test(
data = mtcars, dv_name = "mpg",
iv_1_name = "vs", iv_2_name = "am")
## End(Not run)
```

output_type = "text"

logistic_regression Logistic regression

Description

Conduct a logistic regression analysis

```
logistic_regression(
  data = NULL,
  formula = NULL,
  formula_1 = NULL,
  formula_2 = NULL,
  z_values_keep = FALSE,
  constant_row_clean = TRUE,
  odds_ratio_cols_combine = TRUE,
```

logistic_regression 81

```
round_b_and_se = 3,
      round_z = 3,
      round_p = 3,
      round_odds_ratio = 3,
      round_r_sq = 3,
      round_model_chi_sq = 3,
      pretty_round_p_value = TRUE,
      print_glm_default_summary = FALSE,
      print_summary_dt_list = TRUE,
      print_model_comparison = TRUE,
      output_type = "summary_dt_list"
    )
Arguments
    data
                      a data object (a data frame or a data.table)
                      formula for estimating a single logistic regression model
    formula
    formula 1
                      formula for estimating logistic regression model 1 of 2
    formula_2
                      formula for estimating logistic regression model 2 of 2
    z_values_keep
                      logical. Should the z values be kept in the table? (default = FALSE)
    constant_row_clean
                      logical. Should the row for the constant be cleared except for b and standard
                      error of b? (default = TRUE)
    odds_ratio_cols_combine
                      logical. Should the odds ratio columns be combined? (default = TRUE)
    round_b_and_se number of decimal places to which to round b and standard error of b (default =
                      3)
    round_z
                      number of decimal places to which to round z values (default = 3)
                      number of decimal places to which to round p-values (default = 3)
    round_p
    round_odds_ratio
                      number of decimal places to which to round odds ratios (default = 3)
    round_r_sq
                      number of decimal places to which to round R-squared values (default = 3)
    round_model_chi_sq
                      number of decimal places to which to round model chi-squared values (default
                      = 3)
    pretty_round_p_value
                      logical. Should the p-values be rounded in a pretty format (i.e., lower threshold:
                      "<.001"). By default, pretty_round_p_value = TRUE.
    print_glm_default_summary
                      logical. Should the default summary output of the glm objects be printed? (de-
                      fault = FALSE)
    print_summary_dt_list
                      logical. Should the summaries of logistic regressions in a data table format be
```

printed? (default = TRUE)

```
print_model_comparison
```

logical. Should the comparison of two logistic regression models be printed? (default = TRUE)

output_type

If output_type = "summary_dt_list" (default), the output of the function will be summaries of the two logistic regressions in a data.table format. If output_type = "glm_object_list", the output of the function will be the two glm objects estimating logistic regression models. If output_type = "glm_default_summary_list", the output of the function will be the R's default summary output for the two glm objects estimating logistic regression models. If output_type = "model_comparison_stats", the output of the function will be statistics from comparison of the two logistic regression models. If output_type = "all", the output of the function will be a list of the aforementioned outputs.

Value

the output will be a summary of logistic regression results, unless set otherwise by the output_type argument to the function.

Examples

```
logistic_regression(data = mtcars, formula = am ~ mpg)
logistic_regression(
data = mtcars,
formula_1 = am ~ mpg,
formula_2 = am ~ mpg + wt)
```

logistic_regression_table

Logistic regression table

Description

Construct a table of logistic regression results from the given glm object estimating a logistic regression model.

```
logistic_regression_table(
  logistic_reg_glm_object = NULL,
  z_values_keep = FALSE,
  constant_row_clean = TRUE,
  odds_ratio_cols_combine = TRUE,
  round_b_and_se = 3,
  round_z = 3,
  round_p = 3,
  round_odds_ratio = 3,
  round_r_sq = 3,
  round_model_chi_sq = 3,
```

```
pretty_round_p_value = TRUE
)
```

Arguments

```
logistic_reg_glm_object
                  a glm object estimating a logistic regression model
z_values_keep
                  logical. Should the z values be kept in the table? (default = FALSE)
constant_row_clean
                  logical. Should the row for the constant be cleared except for b and standard
                  error of b? (default = TRUE)
odds_ratio_cols_combine
                  logical. Should the odds ratio columns be combined? (default = TRUE)
round_b_and_se number of decimal places to which to round b and standard error of b (default =
                  number of decimal places to which to round z values (default = 3)
round_z
round_p
                  number of decimal places to which to round p-values (default = 3)
round_odds_ratio
                  number of decimal places to which to round odds ratios (default = 3)
                  number of decimal places to which to round R-squared values (default = 3)
round_r_sq
round_model_chi_sq
                  number of decimal places to which to round model chi-squared values (default
pretty_round_p_value
                  logical. Should the p-values be rounded in a pretty format (i.e., lower threshold:
                  "<.001"). By default, pretty_round_p_value = TRUE.
```

Value

the output will be a summary of logistic regression results.

```
logistic_regression_table(logistic_reg_glm_object =
glm(formula = am ~ mpg, family = binomial(), data = mtcars))
logistic_regression_table(logistic_reg_glm_object =
glm(formula = am ~ mpg, family = binomial(), data = mtcars),
z_values_keep = TRUE, constant_row_clean = FALSE,
odds_ratio_cols_combine = FALSE)
```

```
logistic_reg_w_interaction
```

Logistic regression with an interaction term

Description

Conduct logistic regression for a model with an interaction between two predictor variables

Usage

```
logistic_reg_w_interaction(
  data = NULL,
  dv_name = NULL,
  iv_1_name = NULL,
  iv_2_name = NULL,
  round_p = 3,
  round_chi_sq = 2,
  dv_ordered_levels = NULL,
  iv_1_ordered_levels = NULL,
  iv_2_ordered_levels = NULL,
  one_line_summary_only = FALSE,
  p_value_interaction_only = FALSE,
  return_dt_w_binary = FALSE
```

Arguments

iv_2_ordered_levels

```
data
                  a data object (a data frame or a data.table)
dv_name
                  name of the dependent variable (must be a binary variable)
iv_1_name
                  name of the first independent variable
                  name of the second independent variable
iv_2_name
                  number of decimal places to which to round p-values (default = 3)
round_p
round_chi_sq
                  number of decimal places to which to round chi square statistics (default = 2)
dv_ordered_levels
                  a vector with the ordered levels of the dependent variable, the first and second
                  elements of which will be coded as 0 and 1, respectively, to run logistic regres-
                  sion. E.g., dv_ordered_levels = c("fail", "pass")
iv_1_ordered_levels
                  (only if the first independent variable is a binary variable) a vector with the
                  ordered levels of the first independent variable, the first and second elements of
                  which will be coded as 0 and 1, respectively, to run logistic regression. E.g.,
```

iv_1_ordered_levels = c("control", "treatment")

(only if the second independent variable is a binary variable) a vector with the ordered levels of the first independent variable, the first and second elements of

loglinear_analysis 85

```
which will be coded as 0 and 1, respectively, to run logistic regression. E.g., iv_2\_ordered\_levels = c("male", "female")
```

```
one_line_summary_only
```

logical. Should the output simply be a printout of a one-line summary on the interaction term? (default = FALSE)

```
p_value_interaction_only
```

logical. Should the output simply be a p-value of the interaction term in the logistic regression model? (default = FALSE)

```
return_dt_w_binary
```

logical. If return_dt_w_binary = TRUE, the function will return a data.table with binary variables coded as 0 or 1 (default = FALSE)

Value

the output will be a summary of logistic regression results, unless set otherwise by arguments to the function.

Examples

```
logistic_reg_w_interaction(data = mtcars, dv_name = "vs",
iv_1_name = "mpg", iv_2_name = "am")
```

loglinear_analysis

Loglinear analysis

Description

Conduct a loglinear analysis

```
loglinear_analysis(
  data = NULL,
  dv_name = NULL,
  iv_1_name = NULL,
  iv_2_name = NULL,
  iv_1_values = NULL,
  iv_2_values = NULL,
  output = "all",
  round_p = 3,
  round_chi_sq = 2,
  mosaic_plot = TRUE,
  report_as_field = FALSE
)
```

86 log_odds_ratio

Arguments

data a data object (a data frame or a data.table) dv_name name of the dependent variable name of the first independent variable iv_1_name name of the second independent variable iv_2_name iv_1_values restrict all analyses to observations having these values for the first independent variable iv_2_values restrict all analyses to observations having these values for the second independent variable type of the output. If output_type = "all", the function will return a results output summary and print a mosaic plot. (default = "all") number of decimal places to which to round p-values (default = 3) round_p round_chi_sq number of decimal places to which to round chi-squared test statistics (default = If mosaic_plot = TRUE, a mosaic plot will be printed (default = TRUE) mosaic_plot report_as_field If report_as_field = TRUE, reports summary will follow the format suggested by Andy Field (2012) (ISBN: 978-1-4462-0045-2, p. 851)

Examples

```
loglinear_analysis(data = data.frame(Titanic), "Survived", "Sex", "Age")
```

log_odds_ratio Log odds ratio

Description

Calculate log odds ratio (i.e., ln of odds ratio), as illustrated in Borenstein et al. (2009, p. 36, ISBN: 978-0-470-05724-7)

```
log_odds_ratio(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  contingency_table = NULL,
  ci = 0.95,
  var_include = FALSE,
  invert = FALSE
)
```

log_odds_ratio_to_d 87

Arguments

data a data object (a data frame or a data.table)

iv_name name of the independent variable (grouping variable)

dv_name name of the dependent variable (binary outcome)

contingency_table

a contingency table, which can be directly entered as an input for calculating the

odds ratio

ci width of the confidence interval. Input can be any value less than 1 and greater

than or equal to 0. By default, ci = 0.95. If ci = TRUE, the default value of 0.95

will be used. If ci = FALSE, no confidence interval will be estimated.

var_include logical. Should the output include variance of the log of odds ratio? (default =

FALSE)

invert logical. Whether the inverse of the odds ratio (i.e., 1 / odds ratio) should be

returned.

Examples

```
## Not run:
log_odds_ratio(data = mtcars, iv_name = "vs", dv_name = "am")
log_odds_ratio(contingency_table = matrix(c(5, 10, 95, 90), nrow = 2))
log_odds_ratio(contingency_table = matrix(c(5, 10, 95, 90), nrow = 2),
invert = TRUE)
log_odds_ratio(contingency_table = matrix(c(34, 39, 16, 11), nrow = 2))
log_odds_ratio(contingency_table = matrix(c(34, 39, 16, 11), nrow = 2),
var_include = TRUE)

## End(Not run)
```

log_odds_ratio_to_d
Convert log odds ratio to Cohen's d

Description

Convert log odds ratio to Cohen'd (standardized mean difference), as illustrated in Borenstein et al. (2009, p. 47, ISBN: 978-0-470-05724-7)

Usage

```
log_odds_ratio_to_d(log_odds_ratio = NULL, unname = TRUE)
```

Arguments

log_odds_ratio log odds ratio (the input can be a vector of values), which will be converted to

Cohen's d

unname logical. Should the names from the input be removed? (default = TRUE)

mad_remove_outliers

Examples

```
## Not run:
log_odds_ratio_to_d(log(1))
log_odds_ratio_to_d(log(2))
## End(Not run)
```

mad_remove_outliers

Remove outliers using the MAD method

Description

Detect outliers in a numeric vector using the Median Absolute Deviation (MAD) method and remove or convert them. For more information on MAD, see Leys et al. (2013) doi:10.1016/j.jesp.2013.03.013

Usage

```
mad_remove_outliers(
  x = NULL,
  threshold = 2.5,
  constant = 1.4826,
  convert_outliers_to = NA,
  output_type = "converted_vector"
)
```

Arguments

x a numeric vector

threshold the threshold value for determining outliers. If threshold == 2.5, the median

plus or minus 2.5 times the MAD will be the cutoff values for determining outliers. In other words, values less than the median minus 2.5 times the MAD and values greater than the median plus 2.5 times the MAD will be considered

outliers. By default, threshold == 2.5

constant scale factor for the 'mad' function in the 'stats' package. It is the constant linked

to the assumed distribution. In case of normality, constant = 1.4826. By default,

constant == 1.4826.

convert_outliers_to

the value to which outliers will be converted. For example, if convert_outliers_to = NA, the outlier values will be converted to NA values. If convert_outliers_to = 1000, the outlier values will be converted to 1000. By default, convert_outliers_to

== NA.

output_type typ

type of the output. If output_type = "converted_vector", the function's output will be a vector with outliers converted to the value set by the argument convert_outliers_to. If output_type = "outliers", the function's output will be outliers in the original vector as determined by the MAD method. If

mann_whitney 89

output_type = "cutoff_values", the function's output will be the cutoff values for determining outliers. For example, if outliers will be values less than 0 and greater than 10, the cutoff values will be 0 and 10. If output_type = "non_outlier_values", the function's output will be a vector consisting only of the values that are not outliers; here, the outliers will be removed from the vector, rather than being converted to NA values. By default, output_type = "converted_vector".

Examples

```
## Not run:
mad_remove_outliers(x = c(1, 3, 3, 6, 8, 10, 10, 1000))
mad\_remove\_outliers(x = c(1, 3, 3, 6, 8, 10, 10, 1000, -10000))
# return the vector with the outlier converted to NA values
mad_remove_outliers(
x = c(1, 3, 3, 6, 8, 10, 10, 1000, -10000),
output_type = "converted_vector")
# return the cutoff values for determining outliers
mad_remove_outliers(
x = c(1, 3, 3, 6, 8, 10, 10, 1000, -10000),
output_type = "cutoff_values")
# return the outliers
mad_remove_outliers(
x = c(1, 3, 3, 6, 8, 10, 10, 1000, -10000),
output_type = "outliers")
mad_remove_outliers(
x = c(1, 3, 3, 6, 8, 10, 10, 1000, -10000),
output_type = "non_outlier_values")
## End(Not run)
```

mann_whitney

Mann-Whitney U Test (Also called Wilcoxon Rank-Sum Test)

Description

A nonparametric equivalent of the independent t-test

```
mann_whitney(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  iv_level_order = NULL,
  sigfigs = 3
)
```

90 matrix_prep_dt

Arguments

data a data object (a data frame or a data.table)

iv_name name of the independent variable (grouping variable)

dv_name name of the dependent variable (measure variable of interest)

iv_level_order order of levels in the independent variable. By default, it will be set as levels of the independent variable ordered using R's base function sort.

sigfigs number of significant digits to round to

Value

the output will be a data.table object with all pairwise Mann-Whitney test results

Examples

```
mann_whitney(data = iris, iv_name = "Species", dv_name = "Sepal.Length")
```

Description

Prepare a two-column data.table that will be used to fill values in a matrix

Usage

```
matrix_prep_dt(row_var_names = NULL, col_var_names = NULL)
```

Arguments

row_var_names a vector of variable names, each of which will be header of a row in the eventual

matrix

col_var_names a vector of variable names, each of which will be header of a column in the

eventual matrix

```
matrix_prep_dt(
  row_var_names = c("mpg", "cyl"),
  col_var_names = c("hp", "gear")
)
```

mean_center 91

mean_center

Mean center

Description

Mean-center a variable, i.e., subtract the mean of a numeric vector from each value in the numeric vector

Usage

```
mean_center(x)
```

Arguments

Х

a numeric vector; though not thoroughly tested, the function can accept a matrix as an input.

Examples

```
mean_center(1:5)
mean_center(1:6)
# if the input is a matrix
matrix(1:9, nrow = 3)
mean_center(matrix(1:9, nrow = 3))
```

mediation_analysis

Mediation analysis

Description

Conducts a mediation analysis to estimate an independent variable's indirect effect on dependent variable through a mediator variable. The current version of the package only supports a simple mediation model consisting of one independent variable, one mediator variable, and one dependent variable.

```
mediation_analysis(
  data = NULL,
  iv_name = NULL,
  mediator_name = NULL,
  dv_name = NULL,
  covariates_names = NULL,
  robust_se = TRUE,
  iterations = 1000,
  sigfigs = 3,
```

92 mediation_analysis

```
output_type = "summary_dt",
silent = FALSE
)
```

Arguments

data a data object (a data frame or a data.table)

iv_name name of the independent variable mediator_name name of the mediator variable dv_name name of the dependent variable

covariates_names

names of covariates to control for

robust_se if TRUE, heteroskedasticity-consistent standard errors will be used in quasi-Bayesian

simulations. By default, it will be set as FALSE if nonparametric bootstrap is used

and as TRUE if quasi-Bayesian approximation is used.

iterations number of bootstrap samples. The default is set at 1000, but consider increasing

the number of samples to 5000, 10000, or an even larger number, if slower

handling time is not an issue.

sigfigs number of significant digits to round to

output_type if output_type = "summary_dt", return the summary data.table; if output_type

= "mediate_output", return the output from the mediate function in the 'mediate' package; if output_type = "indirect_effect_p", return the p value associated with the indirect effect estimated in the mediation model (default =

"summary dt")

silent if silent = FALSE, mediation analysis summary, estimation method, sample

size, and number of simulations will be printed; if silent = TRUE, nothing will

be printed. (default = FALSE)

Details

This function requires installing Package 'mediation' v4.5.0 (or possibly a higher version) by Tingley et al. (2019), and uses the source code from a function in the package. https://cran.r-project.org/package=mediation

Value

if output_type = "summary_dt", which is the default, the output will be a data.table showing a summary of mediation analysis results; if output_type = "mediate_output", the output will be the output from the mediate function in the 'mediate' package; if output_type = "indirect_effect_p", the output will be the p-value associated with the indirect effect estimated in the mediation model (a numeric vector of length one).

```
mediation_analysis(
  data = mtcars, iv_name = "cyl",
```

merge_data_tables 93

```
mediator_name = "disp", dv_name = "mpg", iterations = 100
)
mediation_analysis(
  data = iris, iv_name = "Sepal.Length",
  mediator_name = "Sepal.Width", dv_name = "Petal.Length",
  iterations = 100
)
```

merge_data_tables

Merge data tables

Description

Merge two data.table objects. If there are any duplicated ID values and column names across the two data tables, the cell values in the first data.table will remain intact and the cell values in the second data.table will be discarded for the resulting merged data table.

Usage

```
merge_data_tables(dt1 = NULL, dt2 = NULL, id = NULL, silent = TRUE)
```

Arguments

dt1	the first data.table which will remain intact
dt2	the second data.table which will be joined outside of (around) the first data.table. If there are any duplicated ID values and column names across the two data tables, the cell values in the first data.table will remain intact and the cell values in the second data.table will be discarded for the resulting merged data table.
id	name(s) of the column(s) that will contain the ID values in the two data tables. The name(s) of the ID column(s) must be identical in the two data tables.
silent	If silent = TRUE, no message will be printed regarding how many ID values and column names were duplicated. If silent = FALSE, messages will be printed regarding how many column names were duplicated. In cases where only one column was used as the 'id' column (which is the most common case), silent = FALSE will also print messages regarding how many input ID values were duplicated. By default, silent = FALSE.

Value

a data.table object, which merges (joins) the second data.table around the first data.table.

94 merge_data_tables

```
## Example 1: Typical Usage
data_1 <- data.table::data.table(</pre>
id_{col} = c(4, 2, 1, 3),
a = 3:6,
b = 5:8,
c = c("w", "x", "y", "z"))
data_2 <- data.table::data.table(</pre>
id_{col} = c(1, 99, 4),
e = 6:8,
b = c("p", "q", "r"),
d = c(TRUE, FALSE, FALSE))
# check the two example data tables
data_1
# check the result of merging the two data tables above and
# note how data_1 (the upper left portion) is intact in the resulting
# data table
merge_data_tables(dt1 = data_1, dt2 = data_2, id = "id_col")
# compare the result with above with the result from the `merge` function
merge(data_1, data_2, by = "id_col", all = TRUE)
## Example 2: Some values can be converted
data_3 <- data.table::data.table(</pre>
id_{col} = 99,
a = "abc",
b = TRUE,
c = TRUE
data_1
data_3
merge_data_tables(data_1, data_3, id = "id_col")
# In the example above, note how the value of TRUE gets
# converted to 1 in the last row of Column 'b' in the resulting data table
## Example 3: A simpler case
data_4 <- data.table::data.table(</pre>
id_{col} = c(5, 3),
a = c("a", NA))
data_5 <- data.table::data.table(</pre>
id_{col} = 1,
a = 2
# check the two example data tables
data_4
merge_data_tables(data_4, data_5, id = "id_col")
## Example 4: Merging data tables using multiple ID columns
data_6 <- data.table::data.table(</pre>
id_{col_1} = 3:1,
id_col_2 = c("a", "b", "c"),
id_{col_3} = 4:6,
a = 7:9,
b = 10:12
data_7 <- data.table::data.table(</pre>
id_{col_1} = c(3, 2),
```

merge_data_table_list 95

```
id_col_3 = c(3, 5),
id_col_2 = c("a", "b"),
c = 13:14,
a = 15:16)
# check the example data sets
data_6
data_7
# merge data sets using the three id columns
suppressWarnings(merge_data_tables(
dt1 = data_6,
dt2 = data_7,
id = c("id_col_1", "id_col_2", "id_col_3")))
```

Description

Successively merge a list of data.table objects in a recursive fashion. That is, merge the (second data table in the list) around the first data table in the list; then, around this resulting data table, merge the third data table in the list; and so on.

Usage

```
merge_data_table_list(dt_list = NULL, id = NULL, silent = TRUE)
```

Arguments

dt_list	a list of data.table objects
id	name(s) of the column(s) that will contain the ID values in the two data tables. The name(s) of the ID column(s) must be identical in the two data tables.
silent	If silent = TRUE, no message will be printed regarding how many ID values and column names were duplicated. If silent = FALSE, messages will be printed regarding how many column names were duplicated. In cases where only one column was used as the 'id' column (which is the most common case), silent = FALSE will also print messages regarding how many input ID values were duplicated. By default, silent = FALSE.

Details

If there are any duplicated ID values and column names across the data tables, the cell values in the earlier data table will remain intact and the cell values in the later data table will be discarded for the resulting merged data table in each recursion.

Value

a data.table object, which successively merges (joins) a data table around (i.e., outside) the previous data table in the list of data tables.

96 modes_of_objects

Examples

```
data_1 <- data.table::data.table(</pre>
id_{col} = c(4, 2, 1, 3),
a = 3:6,
b = 5:8,
c = c("w", "x", "y", "z"))
data_2 <- data.table::data.table(</pre>
id_{col} = c(1, 4, 99),
d = 6:8,
b = c("p", "q", "r"),
e = c(TRUE, FALSE, FALSE))
data_3 <- data.table::data.table(</pre>
id_{col} = c(200, 3),
f = 11:12,
b = c(300, "abc"))
merge_data_table_list(
dt_list = list(data_1, data_2, data_3), id = "id_col")
```

modes_of_objects

Find modes of objects

Description

Find modes of objects

Usage

```
modes_of_objects(...)
```

Arguments

.. R objects.

Value

the output will be a data.table listing objects and their mods.

```
\label{eq:modes_of_objects} $$ modes_of_objects($ TRUE, FALSE, 1L, 1:3, 1.1, c(1.2, 1.3), "abc", 1 + 2i, intToBits(1L)) $$  \
```

multiple_regression 97

multiple_regression Multiple regression

Description

Conduct multiple regression analysis and summarize the results in a data.table.

Usage

```
multiple_regression(
   data = NULL,
   formula = NULL,
   vars_to_mean_center = NULL,
   mean_center_vars = NULL,
   sigfigs = NULL,
   round_digits_after_decimal = NULL,
   round_p = NULL,
   pretty_round_p_value = TRUE,
   return_table_upper_half = FALSE,
   round_r_squared = 3,
   round_f_stat = 2,
   prettify_reg_table_col_names = TRUE,
   silent = FALSE
)
```

Arguments

```
data
                  a data object (a data frame or a data.table)
formula
                  a formula object for the regression equation
vars_to_mean_center
                  (deprecated) a character vector specifying names of variables that will be mean-
                  centered before the regression model is estimated
mean_center_vars
                  a character vector specifying names of variables that will be mean-centered be-
                  fore the regression model is estimated
sigfigs
                  number of significant digits to round to
round_digits_after_decimal
                  round to nth digit after decimal (alternative to sigfigs)
                  number of decimal places to round p values (overrides all other rounding argu-
round_p
                  ments)
pretty_round_p_value
                  logical. Should the p-values be rounded in a pretty format (i.e., lower threshold:
                  "<.001"). By default, pretty_round_p_value = TRUE.
return_table_upper_half
                  logical. Should only the upper part of the table be returned? By default, return_table_upper_half
                  = FALSE.
```

```
round_r_squared

number of digits after the decimal both r-squared and adjusted r-squared values should be rounded to (default 3)

round_f_stat

number of digits after the decimal the f statistic of the regression model should be rounded to (default 2)

prettify_reg_table_col_names

logical. Should the column names of the regression table be made pretty (e.g., change "std_beta" to "Std. Beta")? (Default = TRUE)

silent

If silent = FALSE, a message regarding mean-centered variables will be printed.
```

Details

To include standardized beta(s) in the regression results table, the following package(s) must be installed prior to running the function: Package 'lm.beta' v1.5-1 (or possibly a higher version) by Stefan Behrendt (2014), https://cran.r-project.org/package=lm.beta

If silent = TRUE, this message will be suppressed. By default, silent = FALSE.

Value

the output will be a data.table showing multiple regression results.

Examples

```
multiple_regression(data = mtcars, formula = mpg ~ gear * cyl)
multiple_regression(
data = mtcars, formula = mpg ~ gear * cyl,
mean_center_vars = "gear",
round_digits_after_decimal = 2)
```

```
noncentrality_parameter
```

Find noncentrality parameter

Description

Find noncentrality parameter

```
noncentrality_parameter(t_stat, df, initial_value = 0, ci = 0.95)
```

odds_ratio 99

Arguments

t_stat the t-statistic associated with the noncentrality parameters

df degrees of freedom associated with the noncentrality parameters

initial_value initial value of the noncentrality parameter for optimization (default = 0). Adjust

this value if results look strange.

ci width of the confidence interval associated with the noncentrality parameters

(default = 0.95)

Examples

```
noncentrality_parameter(4.29, 9)
```

odds_ratio

Odds ratio

Description

Calculate odds ratio, as illustrated in Borenstein et al. (2009, pp. 33-36, ISBN: 978-0-470-05724-7)

Usage

```
odds_ratio(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  contingency_table = NULL,
  ci = 0.95,
  round_ci_limits = 2,
  invert = FALSE
)
```

Arguments

data a data object (a data frame or a data.table)

iv_name name of the independent variable (grouping variable)

dv_name name of the dependent variable (binary outcome)

contingency_table

a contingency table, which can be directly entered as an input for calculating the

odds ratio

ci width of the confidence interval. Input can be any value less than 1 and greater

than or equal to 0. By default, ci = 0.95. If ci = TRUE, the default value of 0.95

will be used. If ci = FALSE, no confidence interval will be estimated.

```
round_ci_limits
```

number of decimal places to which to round the limits of the confidence interval

(default = 2)

invert

logical. Whether the inverse of the odds ratio (i.e., 1 / odds ratio) should be returned.

Examples

```
## Not run:
odds_ratio(data = mtcars, iv_name = "vs", dv_name = "am")
odds_ratio(data = mtcars, iv_name = "vs", dv_name = "am", ci = 0.9)
odds_ratio(contingency_table = matrix(c(5, 10, 95, 90), nrow = 2))
odds_ratio(contingency_table = matrix(c(5, 10, 95, 90), nrow = 2),
invert = TRUE)
odds_ratio(contingency_table = matrix(c(34, 39, 16, 11), nrow = 2))
## End(Not run)
```

```
order_rows_specifically_in_dt
```

Order rows specifically in a data table

Description

Order rows in a data.table in a specific order

Usage

```
order_rows_specifically_in_dt(
  dt = NULL,
  col_to_order_by = NULL,
  specific_order = NULL
)
```

Arguments

```
dt a data.table object

col_to_order_by

a character value indicating the name of the column by which to order the data.table

specific_order a vector indicating a specific order of the values in the column by which to order the data.table.
```

Value

the output will be a data.table object whose rows will be ordered as specified.

outlier 101

Examples

```
order_rows_specifically_in_dt(mtcars, "carb", c(3, 2, 1, 4, 8, 6))
```

outlier Outlier

Description

Return outliers in a vector

Usage

```
outlier(x = NULL, iqr = 1.5, na.rm = TRUE, type = 7, unique_outliers = FALSE)
```

Arguments

Χ	a numeric vector
iqr	a nonnegative constant by which interquartile range (IQR) will be multiplied to build a "fence," outside which observations will be considered outliers. For example, if $iqr = 1.5$, $IQR * 1.5$ will be the "fence" outside which observations will be considered to be outliers. By default, $iqr = 1.5$.
na.rm	logical. na.rm argument to be passed onto the 'quantile' function in the 'stats' package. If true, any NA and NaN's are removed from x before the quantiles are computed.
type	type argument to be passed onto the 'quantile' function in the 'stats' package. An integer between 1 and 9 selecting one of the nine quantile algorithms detailed below to be used. Type '?stats::quantile' for details. By default, type = 7
unique_outliers	
	logical. If unique_outliers = TRUE, the function will return the unique outlier

values in the vector x. By default, unique_outliers = FALSE.

values. If unique_outliers = FALSE, the function will return all the outlier

Value

the output will be a numeric vector with outliers removed.

```
# Example 1
outlier(c(1:10, 100))
# The steps below show how the outlier, 100, was obtained
# v1 is the vector of interest
v1 <- c(1:10, 100)
# quantile
stats::quantile(v1)
# first and third quartiles
q1 <- stats::quantile(v1, 0.25)</pre>
```

102 overlapping_interval

```
q3 <- stats::quantile(v1, 0.75)
# interquartile range
interquartile_range <- unname(q3 - q1)
# fence, using the default 1.5 as the factor to multiply the IQR
cutoff_low <- unname(q1 - 1.5 * interquartile_range)
cutoff_high <- unname(q3 + 1.5 * interquartile_range)
v1[v1 < cutoff_low | v1 > cutoff_high]
```

overlapping_interval Find the overlapping interval of two ranges.

Description

This function should be applied to cases where the two ranges are inclusive of both endpoints. For example, the function can work for a pair of ranges like [0, 1] and [3, 4] but not for pairs like $[0, 1\setminus)$ and $(3, 5\setminus)$

Usage

```
overlapping_interval(
  interval_1_begin = NULL,
  interval_1_end = NULL,
  interval_2_begin = NULL,
  interval_2_end = NULL)
```

Arguments

```
interval_1_begin

a number at which the first interval begins (the left INCLUSIVE endpoint of interval 1)

interval_1_end

a number at which the first interval ends (the right INCLUSIVE endpoint of interval 1)

interval_2_begin

a number at which the second interval begins (the left INCLUSIVE endpoint of interval 2)

interval_2_end

a number at which the second interval ends (the right INCLUSIVE endpoint of interval 2)
```

Value

the output will be NULL if there is no overlapping region or a vector of the endpoints of the overlapping interval.

```
overlapping_interval(1, 3, 2, 4)
overlapping_interval(1, 2.22, 2.22, 3)
```

p0 103

p0 Paste0

Description

A shorthand for the function paste0 Concatenate vectors after converting to character.

Usage

```
p0(..., collapse = NULL, recycle0 = FALSE)
```

Arguments

one or more R objects, to be converted to character vectors. This is the same

argument that would be used in the paste0 function.

collapse an optional character string to separate the results. Not NA_character_. This is

the same argument that would be used in the paste0 function.

recycle0 logical indicating if zero-length character arguments should lead to the zero-

length character(0) after the sep-phase (which turns into "" in the collapse-phase, i.e., when collapse is not NULL). This is the same argument that would be used

in the paste0 function.

Examples

```
paste0("a", "b")
p0("a", "b")
```

```
package_list_default Packages - List the default packages
```

Description

List the default packages in R

Usage

```
package_list_default(package_type = c("base", "recommended"))
```

Arguments

```
package_type a vector of package types. By default, package_type = c("base", "recommended")
```

```
package_list_default()
package_list_default(package_type = "base")
```

104 parallel_analysis

parallel_analysis Pa

Parallel analysis

Description

Conducts a parallel analysis to determine how many factors to retain in a factor analysis.

Usage

```
parallel_analysis(
  data = NULL,
  names_of_vars = NULL,
  iterations = NULL,
  percentile_for_eigenvalue = 95,
  line_types = c("dashed", "solid"),
  colors = c("red", "blue"),
  eigenvalue_random_label_x_pos = NULL,
  eigenvalue_random_label_y_pos = NULL,
  unadj_eigenvalue_label_x_pos = NULL,
  unadj_eigenvalue_label_y_pos = NULL,
  label_offset_percent = 2,
  label_size = 6,
  dot_size = 5,
  line_thickness = 1.5,
  y_axis_title_vjust = 0.8,
  title_text_size = 26,
  axis_text_size = 22
)
```

Arguments

```
data
                  a data object (a data frame or a data.table)
names_of_vars
                  names of the variables
iterations
                  number of random data sets. If no input is entered, this value will be set as 30 *
                  number of variables.
percentile_for_eigenvalue
                  percentile used in estimating bias (default = 95).
line_types
                  types of the lines connecting eigenvalues. By default, line_types = c("dashed",
                  "solid")
colors
                  size of the dots denoting eigenvalues (default = 5).
eigenvalue_random_label_x_pos
                  (optional) x coordinate of the label for eigenvalues from randomly generated
                  data.
eigenvalue_random_label_y_pos
                  (optional) y coordinate of the label for eigenvalues from randomly generated
                  data.
```

percentile_rank 105

```
unadj_eigenvalue_label_x_pos
                  (optional) x coordinate of the label for unadjusted eigenvalues
unadj_eigenvalue_label_y_pos
                  (optional) y coordinate of the label for unadjusted eigenvalues
label_offset_percent
                  How much should labels for the eigenvalue curves be offset, as a percentage of
                  the plot's x and y range? (default = 2)
                  size of the labels for the eigenvalue curves (default = 6).
label_size
dot_size
                  size of the dots denoting eigenvalues (default = 5).
line_thickness thickness of the eigenvalue curves (default = 1.5).
y_axis_title_vjust
                  position of the y axis title as a proportion of the range (default = 0.8).
title_text_size
                  size of the plot title (default = 26).
axis_text_size size of the text on the axes (default = 22).
```

Details

The following package(s) must be installed prior to running the function: Package 'paran' v1.5.2 (or possibly a higher version) by Alexis Dinno (2018), https://cran.r-project.org/package=paran

Examples

```
parallel_analysis(
  data = mtcars, names_of_vars = c("disp", "hp", "drat"))
# parallel_analysis(
# data = mtcars, names_of_vars = c("carb", "vs", "gear", "am"))
```

percentile_rank

Percentile rank

Description

Calculate percentile rank of each value in a vector

Usage

```
percentile_rank(vector)
```

Arguments

vector

a numeric vector

106 pivot_table

Examples

```
percentile_rank(1:5)
percentile_rank(1:10)
percentile_rank(1:100)
```

pivot_table

Pivot Table

Description

Create a pivot table.

Usage

```
pivot_table(
  data = NULL,
  row_names = NULL,
  col_names = NULL,
  function_as_character = NULL,
  sigfigs = 3,
  output = "dt",
  remove_col_names = TRUE
)
```

Arguments

data a data object (a data frame or a data.table)
row_names names of variables for constructing rows

col_names names of variables for constructing columns independent variables

function_as_character

function to perform for each cell in the pivot table

sigfigs number of significant digits to which to round values in the pivot table (default

= 3)

output type of output. If output = "dt", the function's output will be a pivot table in a

data.table format. If output = "subsets", the function's output will be a list of data tables that are subsets representing each cell in the pivot table. By default,

output = "dt"

remove_col_names

logical. Should the column names (i.e., v1, v2, ...) be removed in the data table output?

Value

the output will be a contingency table in a data.table format

plot_group_means 107

Examples

```
pivot_table(
  data = mtcars, col_names = "am", row_names = c("cyl", "vs"),
  function_as_character = "mean(mpg)")
pivot_table(
  data = mtcars, col_names = "am", row_names = c("cyl", "vs"),
  function_as_character = "sum(mpg < 17)")
pivot_table(
  data = mtcars, col_names = "am", row_names = c("cyl", "vs"),
  function_as_character =
  "round(sum(mpg < 17) / sum(!is.na(mpg)) * 100, 0)")</pre>
```

plot_group_means

Plot group means

Description

Creates a plot of sample means and error bars by group.

```
plot_group_means(
  data = NULL,
  dv_name = NULL,
  iv_name = NULL,
 na.rm = TRUE,
 error_bar = "ci",
  error_bar_range = 0.95,
 error_bar_tip_width = 0.13,
 error_bar_thickness = 1,
  error_bar_caption = TRUE,
  lines_connecting_means = TRUE,
  line_colors = NULL,
  line_types = NULL,
  line_thickness = 1,
  line_size = NULL,
  dot_size = 3,
  position_dodge = 0.13,
  x_axis_title = NULL,
 y_axis_title = NULL,
 y_axis_title_vjust = 0.85,
 legend_title = NULL,
  legend_position = "right"
)
```

108 plot_group_means

Arguments

data a data object (a data frame or a data.table)

dv_name name of the dependent variable

iv_name name(s) of the independent variable(s). Up to two independent variables can be

supplied.

na.rm logical. If na.rm = TRUE, NA values in independent and dependent variables will

be removed before calculating group means.

error_bar if error_bar = "se"; error bars will be +/-1 standard error, if error_bar = "ci"

error bars will be a confidence interval; if error_bar = "pi", error bars will be

a prediction interval

error_bar_range

width of the confidence or prediction interval (default = 0.95 for 95 percent confidence or prediction interval). This argument will not apply when error_bar =

"se"

error_bar_tip_width

graphically, width of the segments at the end of error bars (default = 0.13)

error_bar_thickness

thickness of the error bars (default = 1)

error_bar_caption

should a caption be included to indicate the width of the error bars? (default =

TRUE).

lines_connecting_means

logical. Should lines connecting means within each group be drawn? (default =

TRUE)

line_colors colors of the lines connecting means (default = NULL) If the second IV has two

levels, then by default, line_colors = c("red", "blue")

line_types types of the lines connecting means (default = NULL) If the second IV has two

levels, then by default, line_types = c("solid", "dashed")

line_thickness thickness of the lines connecting group means (default = 1)

line_size Deprecated. Use the 'linewidth' argument instead. (default = 1)

dot_size size of the dots indicating group means (default = 3)

position_dodge by how much should the group means and error bars be horizontally offset from

each other so as not to overlap? (default = 0.13)

x_axis_title a character string for the x-axis title. If no input is entered, then, by default, the

first value of iv_name will be used as the x-axis title.

y_axis_title a character string for the y-axis title. If no input is entered, then, by default,

dv_name will be used as the y-axis title.

y_axis_title_vjust

position of the y axis title (default = 0.85). By default, y_axis_title_vjust = 0.85, which means that the y axis title will be positioned at 85% of the way up

from the bottom of the plot.

legend_title a character for the legend title. If no input is entered, then, by default, the

second value of iv_name will be used as the legend title. If legend_title =

FALSE, then the legend title will be removed.

pm 109

```
legend_position
```

```
position of the legend: "none", "top", "right", "bottom", "left", "none"
(default = "right")
```

Value

by default, the output will be a ggplot object. If output = "table", the output will be a data.table object.

Examples

```
plot_group_means(data = mtcars, dv_name = "mpg", iv_name = c("vs", "am"))
plot_group_means(
  data = mtcars, dv_name = "mpg", iv_name = c("vs", "am"),
  error_bar = "se"
plot_group_means(
  data = mtcars, dv_name = "mpg", iv_name = c("vs", "am"),
  error_bar = "pi", error_bar_range = 0.99
# set line colors and types manually
plot_group_means(
data = mtcars, dv_name = "mpg", iv_name = c("vs", "am"),
line_colors = c("green4", "purple"),
line_types = c("solid", "solid"))
# remove axis titles
plot_group_means(
data = mtcars, dv_name = "mpg", iv_name = c("vs", "am"),
x_axis_title = FALSE, y_axis_title = FALSE, legend_title = FALSE)
```

pm

Paste for message

Description

Combines the base functions paste0 and message

Usage

```
pm(..., collapse = NULL)
```

Arguments

one or more R objects, to be converted to character vectors. Input(s) to this

argument will be passed onto the paste0 function.

collapse an optional character string to separate the results. Not NA_character_. In-

put(s) to this argument will be passed onto the paste0 function.

110 prep

Value

there will be no output from this function. Rather, a message will be generated from the arguments.

Examples

```
pm("hello", 123)
pm(c("hello", 123), collapse = ", ")
```

population_variance

Population variance of a vector

Description

Calculates the population variance, rather than the sample variance, of a vector

Usage

```
population_variance(vector, na.rm = TRUE)
```

Arguments

vector a numeric vector

na.rm if TRUE, NA values will be removed before calculation

Examples

```
population_variance(1:4)
var(1:4)
```

prep

Prepare package(s) for use

Description

Installs, loads, and attaches package(s). If package(s) are not installed, installs them prior to loading and attaching.

```
prep(
    ...,
    pkg_names_as_object = FALSE,
    silent_if_successful = FALSE,
    silent_load_pkgs = NULL
)
```

pretty_round_p_value 111

Arguments

names of packages to load and attach, separated by commas, e.g., "ggplot2", data.table. The input can be any number of packages, whose names may or may not be wrapped in quotes.

pkg_names_as_object

logical. If pkg_names_as_object = TRUE, the input will be evaluated as one object containing package names. If pkg_names_as_object = FALSE, the input will be considered as literal packages names (default = FALSE).

silent_if_successful

logical. If silent_if_successful = TRUE, no message will be printed if preparation of package(s) is successful. If silent_if_successful = FALSE, a message indicating which package(s) were successfully loaded and attached will be printed (default = FALSE).

silent_load_pkgs

a character vector indicating names of packages to load silently (i.e., suppress messages that get printed when loading the packaged). By default, silent_load_pkgs = NULL

Value

there will be no output from this function. Rather, packages given as inputs to the function will be installed, loaded, and attached.

Examples

```
prep(data.table)
prep("data.table", silent_if_successful = TRUE)
prep("base", utils, ggplot2, "data.table")
pkgs <- c("ggplot2", "data.table")
prep(pkgs, pkg_names_as_object = TRUE)
prep("data.table", silent_load_pkgs = "data.table")</pre>
```

Description

Round p-values to the desired number of decimals and remove leading 0s before the decimal.

```
pretty_round_p_value(
   p_value_vector = NULL,
   round_digits_after_decimal = 3,
   include_p_equals = FALSE
)
```

112 pretty_round_r

Arguments

Value

the output will be a character vector with p values, e.g., a vector of strings like "< .001" (or "p < .001").

Examples

```
pretty_round_p_value(0.0495, 3)
pretty_round_p_value(
    p_value_vector = 0.049,
    round_digits_after_decimal = 2, include_p_equals = FALSE)
pretty_round_p_value(c(0.0015, 0.0014, 0.0009), include_p_equals = TRUE)
```

pretty_round_r

Pretty round r

Description

Round correlation coefficients in APA style (7th Ed.)

Usage

```
pretty_round_r(r = NULL, round_digits_after_decimal = 2)
```

Arguments

```
r a (vector of) correlation coefficient(s)
round_digits_after_decimal
how many digits after the decimal point should the p-value be rounded to? (default = 2)
```

Value

the output will be a character vector of correlation coefficient(s).

```
pretty_round_r(r = -0.123) pretty_round_r(c(-0.12345, 0.45678), round_digits_after_decimal = 3) pretty_round_r(c(-0.12, 0.45), round_digits_after_decimal = 4)
```

print_loop_progress 113

Description

Print current progress inside a loop (e.g., for loop or lapply)

Usage

```
print_loop_progress(
  iteration_number = NULL,
  iteration_start = 1,
  iteration_end = NULL,
  text_before = "",
  percent = 1,
  output_method = "cat"
)
```

Arguments

```
for (i in seq_len(250)) {
   Sys.sleep(0.001)
   print_loop_progress(
     iteration_number = i,
     iteration_end = 250)
}
unlist(lapply(seq_len(7), function (i) {
   Sys.sleep(0.1)
   print_loop_progress(
     iteration_number = i,
     iteration_end = 7)
   return(i)
}))
```

```
proportion_of_values_in_vector
```

Proportion of given values in a vector

Description

Proportion of given values in a vector

Usage

```
proportion_of_values_in_vector(
  values = NULL,
  vector = NULL,
  na.exclude = TRUE,
  output_type = "proportion",
  silent = FALSE,
  conf.level = 0.95,
  correct_yates = TRUE
)
```

Arguments

values a set of values that will count as successes (hits)

vector a numeric or character vector containing successes (hits) and failures (misses)

na.exclude if TRUE, NA values will be removed both from vector and values before cal-

culation (default = TRUE).

output_type By default, output_type = "proportion". If output_type = "proportion",

the function will return the calculated proportion; if output_type = "se", the function will return the standard error of the sample proportion; if output_type = "dt", the function will return the data table of proportion and confidence

intervals.

silent If silent = TRUE, no message will be printed regarding number of NA values or

confidence interval. (default = FALSE)

conf. level confidence level of the returned confidence interval. Input to this argument will

be passed onto the conf.level argument in the prop. test function from the de-

fault stats package.

correct_yates a logical indicating whether Yates' continuity correction should be applied where

possible (default = TRUE). Input to this argument will be passed onto the correct

argument in the prop. test function from the default stats package.

```
proportion_of_values_in_vector(
  values = 2:3, vector = c(rep(1:3, each = 10), rep(NA, 10))
)
```

q_stat_test_homo_r 115

```
proportion_of_values_in_vector(
  values = 2:3, vector = c(rep(1:3, each = 10), rep(NA, 10)),
  output_type = "se"
)
proportion_of_values_in_vector(
  values = 2:3, vector = c(rep(1:3, each = 10), rep(NA, 10)),
  conf.level = 0.99
)
proportion_of_values_in_vector(
  values = c(2:3, NA), vector = c(rep(1:3, each = 10), rep(NA, 10)),
  na.exclude = FALSE
)
```

q_stat_test_homo_r

Q statistic for testing homogeneity of correlations

Description

Calculate the Q statistic to test for homogeneity of correlation coefficients. See p. 235 of the book Hedges & Olkin (1985), Statistical Methods for Meta-Analysis (ISBN: 0123363802).

Usage

```
q_stat_test_homo_r(z = NULL, n = NULL)
```

Arguments

z a vector of z values

n a vector of sample sizes which will be used to calculate the weights, which in turn will be used to calculate the weighted z.

Value

the output will be a weighted z value.

```
q_stat_test_homo_r(1:3, c(100, 200, 300))

q_stat_test_homo_r(z = c(1:3, NA), n = c(100, 200, 300, NA))
```

116 read_sole_csv

read_csv

Read a csv file

Description

Read a csv file

Usage

```
read_csv(name = NULL, head = FALSE, dirname = NULL, ...)
```

Arguments

name a character string of the csv file name without the ".csv" extension. For example,

if the csv file to read is "myfile.csv", enter name = "myfile"

head logical. if head = TRUE, prints the first five rows of the data set.

dirname a character string of the directory containing the csv file, e.g., dirname = "c:/Users/Documents"

optional arguments for the fread function from the data.table package. Any

arguments for data.table's fread function can be used, e.g., fill = TRUE, nrows

= 100

Value

the output will be a data.table object, that is, an output from the data.table function, fread

Examples

```
## Not run:
mydata <- read_csv("myfile")
## End(Not run)</pre>
```

read_sole_csv

Read the sole csv file in the working directory

Description

Read the sole csv file in the working directory

```
read_sole_csv(head = FALSE, ...)
```

regex_match 117

Arguments

head logical. if head = TRUE, prints the first five rows of the data set.

... optional arguments for the fread function from the data.table package. Any

arguments for data.table's fread function can be used, e.g., fill = TRUE, nrows

= 100

Value

the output will be a data.table object, that is, an output from the data.table function, fread

Examples

```
mydata <- read_sole_csv()
mydata <- read_sole_csv(head = TRUE)
mydata <- read_sole_csv(fill = TRUE, nrows = 5)</pre>
```

regex_match

Regular expression matches

Description

Returns elements of a character vector that match the given regular expression

Usage

```
regex_match(regex = NULL, vector = NULL, silent = FALSE, perl = FALSE)
```

Arguments

regex a i	regular expression	provided, a defau	It theme will be used.
-----------	--------------------	-------------------	------------------------

vector a character vector in which to search for regular expression matches, or a data

table whose column names will be searched

silent logical. If silent = FALSE, a report on regular expression matches will be

printed. If silent = TRUE, the report on regular expression matches will not

be printed. By default, silent = FALSE

perl logical. Should Perl-compatible regexps be used?

```
regex_match("p$", names(mtcars))
colnames_ending_with_p <- regex_match("p$", names(mtcars))</pre>
```

```
rel_pos_of_value_in_vector
```

Find relative position of a value in a vector

Description

Find relative position of a value in a vector that may or may not contain the value

Usage

```
rel_pos_of_value_in_vector(value = NULL, vector = NULL)
```

Arguments

value a value whose relative position is to be searched in a vector

vector a numeric vector

Value

a number indicating the relative position of the value in the vector

Examples

```
rel_pos_of_value_in_vector(value = 3, vector = c(2, 4))
rel_pos_of_value_in_vector(value = 3, vector = c(2, 6))
rel_pos_of_value_in_vector(value = 3, vector = 1:3)
```

```
rel_value_of_pos_in_vector
```

Find relative value of a position in a vector

Description

Find relative value of a position in a vector

Usage

```
rel_value_of_pos_in_vector(vector = NULL, position = NULL)
```

Arguments

vector a numeric vector position position of a vector

remove_from_vector 119

Value

a number indicating the relative value of the position in the vector

Examples

```
rel_value_of_pos_in_vector(vector = c(0, 100), position = 1.5)
rel_value_of_pos_in_vector(vector = 2:4, position = 2)
rel_value_of_pos_in_vector(vector = c(2, 4, 6), position = 2.5)
```

remove_from_vector

Remove from a vector

Description

Remove certain values from a vector

Usage

```
remove_from_vector(values = NULL, vector = NULL, silent = FALSE)
```

Arguments

values	a single value or a vector of values which will be removed from the target vector
vector	a character or numeric vector
silent	if silent = FALSE, a summary of values removed will be printed; if silent = TRUE, such summary will not be printed. By default, silent = FALSE

Value

the output will be a vector with the given values removed.

```
remove_from_vector(values = 1, vector = 1:3)
remove_from_vector(values = NA, vector = c(1:3, NA))
remove_from_vector(values = c(1, NA), vector = c(1:3, NA))
remove_from_vector(values = 1:5, vector = 1:10)
```

```
remove_user_installed_pkgs
```

Remove all user installed packages

Description

Remove all user installed packages

Usage

```
remove_user_installed_pkgs(
  exceptions = NULL,
  type_of_pkg_to_keep = c("base", "recommended"),
  keep_kim = FALSE
)
```

Arguments

other user-installed packages. If keep_kim = TRUE, Package 'kim' will not be

Examples

```
## Not run:
remove_user_installed_pkgs()
## End(Not run)
```

```
repeated_measures_anova
```

Repeated-Measures ANVOA

removed. By default, keep_kim = FALSE

Description

Conduct a repeated-measures analysis of variance (ANOVA). This analysis will be appropriate for within-subjects experimental design.

Usage

```
repeated_measures_anova(
  data = NULL,
  p_col_name = NULL,
  measure_vars = NULL,
  histograms = TRUE,
  round_w = 2,
  round_epsilon = 2,
  round_df_model = 2,
  round_df_error = 2,
  round_f = 2,
  round_ges = 2
)
```

Arguments

data	a data object (a data frame or a data.table)
p_col_name	name of the column identifying participants
measure_vars	names of the columns containing repeated measures (within-subjects variables)
histograms	logical. If histograms = TRUE, histograms of the repeated measures will be plotted. If histograms = FALSE, no histograms will be plotted.
round_w	number of decimal places to which to round W statistic from Mauchly's test $(default = 2)$
round_epsilon	number of decimal places to which to round the epsilon statistic from Greenhouse-Geisser or Huynh-Feldt correction (default $= 2$)
round_df_model	number of decimal places to which to round the corrected degrees of freedom for model (default = 2)
round_df_error	number of decimal places to which to round the corrected degrees of freedom for error (default = 2)
round_f	number of decimal places to which to round the F statistic (default = 2)
round_ges	number of decimal places to which to round generalized eta-squared (default $=$ 2)

Details

The following package(s) must be installed prior to running the function: Package 'ez' v4.4-0 (or possibly a higher version) by Michael A Lawrence (2016), https://cran.r-project.org/package=ez

```
## Not run:
repeated_measures_anova(
  data = mtcars, p_col_name = "cyl", measure_vars = c("wt", "qsec"))
## End(Not run)
```

robust_regression

Description

Replace values in a data.table

Usage

```
replace_values_in_dt(
  data = NULL,
  old_values = NULL,
  new_values = NULL,
  silent = FALSE
)
```

Arguments

a data object (a data frame or a data.table)

old_values a vector of old values that need to be replaced

new_values a new value or a vector of new values that will replace the old values

silent If silent = FALSE, a message will be printed regarding how many values were replaced. If silent = TRUE, no message will be printed regarding how many values were replaced. (default = FALSE)

Examples

```
replace_values_in_dt(data = mtcars, old_values = 21.0, new_values = 888)
replace_values_in_dt(data = mtcars, old_values = c(0, 1), new_values = 999)
replace_values_in_dt(
data = mtcars, old_values = c(0, 1), new_values = 990:991)
replace_values_in_dt(
data = data.table::data.table(a = NA_character_, b = NA_character_),
old_values = NA, new_values = "")
```

robust_regression Robust regression (bootstrapped regression)

Description

Estimate coefficients in a multiple regression model by bootstrapping.

round_flexibly 123

Usage

```
robust_regression(
  data = NULL,
  formula = NULL,
  sigfigs = NULL,
  round_digits_after_decimal = NULL,
  iterations = 1000
)
```

Arguments

data a data object (a data frame or a data.table)

formula a formula object for the regression equation

sigfigs number of significant digits to round to

round_digits_after_decimal

round to nth digit after decimal (alternative to sigfigs)

iterations number of bootstrap samples. The default is set at 1000, but consider increasing

the number of samples to 5000, 10000, or an even larger number, if slower

handling time is not an issue.

Details

The following package(s) must be installed prior to running this function: Package 'boot' v1.3-26 (or possibly a higher version) by Canty & Ripley (2021), https://cran.r-project.org/package=boot

Examples

```
## Not run:
robust_regression(
  data = mtcars, formula = mpg ~ cyl * hp,
  iterations = 100
)
## End(Not run)
```

round_flexibly

Round flexibly

Description

Round numbers to a flexible number of significant digits. "Flexible" rounding refers to rounding all numbers to the highest level of precision seen among numbers that would have resulted from the 'signif()' function in base R. The usage examples of this function demonstrate flexible rounding (see below).

124 round_flexibly

Usage

```
round_flexibly(x = NULL, sigfigs = 3)
```

Arguments

x a numeric vector sigfigs number of significant digits to flexibly round to. By default, sigfigs = 3.

Value

the output will be a numeric vector with values rounded to the highest level of precision seen among numbers that result from the 'signif()' function in base R.

```
# Example 1
# First, observe results from the 'signif' function:
c(0.00012345, pi)
signif(c(0.00012345, pi), 3)
# In the result above, notice how info is lost on some digits
# (e.g., 3.14159265 becomes 3.140000).
# In contrast, flexible rounding retains the lost info in the digits
round_flexibly(x = c(0.00012345, pi), sigfigs = 3)
# Example 2
# Again, first observe results from the 'signif' function:
c(0.12345, 1234, 0.12, 1.23, .01)
signif(c(0.12345, 1234, 0.12, 1.23, .01), 3)
# In the result above, notice how info is lost on some digits
# (e.g., 1234 becomes 1230.000).
# In contrast, flexible rounding retains the lost info in the digits.
# Specifically, in the example below, 0.12345 rounded to 3 significant
# digits (default) is signif(0.12345, 3) = 0.123 (3 decimal places).
# Because this 3 decimal places is the highest precision seen among
# all numbers, all other numbers will also be rounded to 3 decimal places.
round_flexibly(
c(0.12345, 1234, 0.12, 1.23, .01))
# If the input is a character vector, the original input will be returned.
round_flexibly(c("a", "b", "c"))
# Example 4
# If the input is a list (e.g., a data.frame) that contains at least
# one numeric vector, the numeric vector element(s) will be rounded
round_flexibly(data.frame(a = c(1.2345, 123.45), b = c("a", "b")))
# Example 5
# If the input is a matrix, all numbers will be rounded flexibly
round_flexibly(matrix(
```

scatterplot 125

```
c(1.23, 2.345, 3.4567, 4.56789), ncol = 2), sigfigs = 3)
```

scatterplot

Scatterplot

Description

Creates a scatter plot and calculates a correlation between two variables.

```
scatterplot(
 data = NULL,
 x_var_name = NULL,
 y_var_name = NULL,
 dot_label_var_name = NULL,
 weight_var_name = NULL,
  alpha = 1,
  annotate_stats = TRUE,
  annotate_y_pos_rel = 5,
  annotate_y_pos_abs = NULL,
  annotated_stats_color = "green4",
  annotated_stats_font_size = 6,
  annotated_stats_font_face = "bold",
  line_of_fit_type = "lm",
  ci_for_line_of_fit = FALSE,
  line_of_fit_color = "blue",
  line_of_fit_thickness = 1,
  dot_color = "black",
  x_axis_label = NULL,
 y_axis_label = NULL,
 x_axis_tick_marks = NULL,
 y_axis_tick_marks = NULL,
 dot_size = 2,
  dot_label_size = NULL,
  dot_size_range = c(3, 12),
  jitter_x_y_percent = 0,
  jitter_x_percent = 0,
  jitter_y_percent = 0,
  cap_axis_lines = TRUE,
  color_dots_by = NULL,
  png_name = NULL,
  save_as_png = FALSE,
 width = 13,
  height = 9
)
```

126 scatterplot

Arguments

a data object (a data frame or a data.table) data name of the variable that will go on the x axis x_var_name name of the variable that will go on the y axis y_var_name dot_label_var_name name of the variable that will be used to label individual observations weight_var_name name of the variable by which to weight the individual observations for calculating correlation and plotting the line of fit alpha opacity of the dots (0 = completely transparent, 1 = completely opaque) annotate_stats if TRUE, the correlation and p-value will be annotated at the top of the plot (default = TRUEannotate_y_pos_rel position of the annotated stats, expressed as a percentage of the range of y values by which the annotated stats will be placed above the maximum value of y in the data set (default = 5). This value will be determined relative to the data. If annotate_y_pos_rel = 5, and the minimum and maximum y values in the data set are 0 and 100, respectively, the annotated stats will be placed at 5% of the y range (100 - 0) above the maximum y value, y = 0.05 * (100 - 0) + 100 = 105. annotate_y_pos_abs as an alternative to the argument annotate_y_pos_rel, the input for this argument will determine the position of the annotated stats. If annotate_y_pos_abs = 7.5, then the annotated stats will be placed at the y coordinate of 7.5. By default, this argument will be ignored unless it receives an input. That is, by default, the function will use the default value of the annotate_y_pos_rel argument to determine the y coordinate of the annotated stats. annotated_stats_color color of the annotated stats (default = "green4"). annotated_stats_font_size font size of the annotated stats (default = 6). annotated_stats_font_face font face of the annotated stats (default = "bold"). line_of_fit_type if line_of_fit_type = "lm", a regression line will be fit; if line_of_fit_type = "loess", a local regression line will be fit; if line_of_fit_type = "none", no line will be fit ci_for_line_of_fit if ci_for_line_of_fit = TRUE, confidence interval for the line of fit will be shaded line_of_fit_color color of the line of fit (default = "blue") line_of_fit_thickness thickness of the line of fit (default = 1) dot_color color of the dots (default = "black")

scatterplot 127

x_axis_label alternative label for the x axis
y_axis_label alternative label for the y axis
x_axis_tick_marks

a numeric vector indicating the positions of the tick marks on the x axis

y_axis_tick_marks

a numeric vector indicating the positions of the tick marks on the y axis

 dot_size size of the dots on the plot (default = 2)

dot_label_size size for dots' labels on the plot. If no input is entered for this argument, it will be set as dot_label_size = 5 by default. If the plot is to be weighted by some variable, this argument will be ignored, and dot sizes will be determined by the

argument dot_size_range

dot_size_range minimum and maximum size for dots on the plot when they are weighted jitter_x_y_percent

horizontally and vertically jitter dots by a percentage of the respective ranges of x and y values.

jitter_x_percent

horizontally jitter dots by a percentage of the range of x values.

jitter_y_percent

vertically jitter dots by a percentage of the range of y values

cap_axis_lines logical. Should the axis lines be capped at the outer tick marks? (default =

TRUE)

color_dots_by name of the variable that will determine colors of the dots

png_name name of the PNG file to be saved. By default, the name will be "scatterplot_"

followed by a timestamp of the current time. The timestamp will be in the format, jan_01_2021_1300_10_000001, where "jan_01_2021" would indicate January 01, 2021; 1300 would indicate 13:00 (i.e., 1 PM); and 10_000001 would

indicate 10.000001 seconds after the hour.

save_as_png if save = TRUE, the plot will be saved as a PNG file.

width width of the plot to be saved. This argument will be directly entered as the width

argument for the ggsave function within ggplot2 package (default = 16)

height height of the plot to be saved. This argument will be directly entered as the

height argument for the ggsave function within ggplot2 package (default = 9)

Details

If a weighted correlation is to be calculated, the following package(s) must be installed prior to running the function: Package 'weights' v1.0 (or possibly a higher version) by John Pasek (2018), https://cran.r-project.org/package=weights

Value

the output will be a scatter plot, a ggplot object.

128 score_scale_items

Examples

```
## Not run:
scatterplot(data = mtcars, x_var_name = "wt", y_var_name = "mpg")
scatterplot(
    data = mtcars, x_var_name = "wt", y_var_name = "mpg",
    dot_label_var_name = "hp", weight_var_name = "drat",
    annotate_stats = TRUE)
scatterplot(
    data = mtcars, x_var_name = "wt", y_var_name = "mpg",
    dot_label_var_name = "hp", weight_var_name = "cyl",
    dot_label_size = 7, annotate_stats = TRUE)
scatterplot(
data = mtcars, x_var_name = "wt", y_var_name = "mpg",
color_dots_by = "gear")
## End(Not run)
```

score_scale_items

Score scale items

Description

Score items in a scale (e.g., Likert scale items) by computing the sum or mean of the items.

Usage

```
score_scale_items(
  item_list = NULL,
  reverse_item_list = NULL,
  operation = "mean",
  na.rm = FALSE,
  na_summary = TRUE,
  reverse_code_minuend = NULL
)
```

Arguments

item_list a list of scale items (i.e., list of vectors of ratings) to code normally (as opposed

to reverse coding).

reverse_item_list

a list of scale items to reverse code.

operation if operation = "mean", mean of the scale items will be calculated; if operation

= "sum", sum of the scale items will be calculated (default = "mean").

na.rm logical. The na.rm argument that will be passed onto the base R's rowMeans or

rowSums function (default = FALSE).

na_summary logical. If na_summary = TRUE a summary of NA values will be printed; if

na_summary = FALSE the summary will not be printed (default = TRUE).

setup_r_env 129

```
reverse_code_minuend
```

required for reverse coding; the number from which to subtract item ratings when reverse-coding. For example, if the items to reverse code are measured on a 7-point scale, enter reverse_code_minuend = 8.

Examples

```
score_scale_items(item_list = list(1:5, rep(3, 5)),
reverse_item_list = list(rep(5, 5)), reverse_code_minuend = 6)
score_scale_items(item_list = list(c(1, 1), c(1, 5)),
reverse_item_list = list(c(5, 3)),
reverse_code_minuend = 6, na_summary = FALSE)
score_scale_items(item_list = list(c(1, 1), c(1, 5)),
reverse_item_list = list(c(5, 1)),
reverse_code_minuend = 6, operation = "sum")
score_scale_items(item_list = list(1:5, rep(3, 5)))
score_scale_items(item_list = list(c(1, NA, 3), c(NA, 2, 3)))
score_scale_items(item_list = list(c(1, NA, 3), c(NA, 2, 3))), na.rm = TRUE)
```

setup_r_env

Set up R environment

Description

Set up R environment by (1) clearing the console; (2) removing all objects in the global environment; (3) setting the working directory to the active document (in RStudio only); (4) unloading and loading the kim package.

Usage

```
setup_r_env(
  clear_console = TRUE,
  clear_global_env = TRUE,
  setwd_to_active_doc = TRUE,
  prep_kim = TRUE
)
```

Arguments

se_of_mean

Examples

```
## Not run:
setup_r_env()
## End(Not run)
```

setwd_to_active_doc

Set working directory to active document in RStudio

Description

Set working directory to location of the active document in RStudio

Usage

```
setwd_to_active_doc()
```

Value

there will be no output from this function. Rather, the working directory will be set as location of the active document.

Examples

```
## Not run:
setwd_to_active_doc()
## End(Not run)
```

se_of_mean

Standard error of the mean

Description

Standard error of the mean

Usage

```
se_of_mean(vector, na.rm = TRUE, notify_na_count = NULL)
```

Arguments

vector a numeric vector

na.rm if TRUE, NA values will be removed before calculation

notify_na_count

if TRUE, notify how many observations were removed due to missing values. By default, NA count will be printed only if there are any NA values.

se_of_percentage 131

Value

the output will be a numeric vector of length one, which will be the standard error of the mean for the given numeric vector.

Examples

```
se_of_mean(c(1:10, NA))
```

se_of_percentage

Standard Error (SE) of a percentage

Description

Calculate the standard error of a percentage. See Fowler, Jr. (2014, p. 34, ISBN: 978-1-4833-1240-8)

Usage

```
se_of_percentage(percent = NULL, n = NULL)
```

Arguments

percent a vector of percentages; each of the percentage values must be between 0 and

100

n a vector of sample sizes; number of observations used to calculate each of the

percentage values

Examples

```
se_of_percentage(percent = 40, n = 50)
se_of_percentage(percent = 50, n = 10)
```

se_of_proportion

Standard Error (SE) of a proportion

Description

Calculate the standard error of a proportion. See Anderson and Finn (1996, p. 364, ISBN: 978-1-4612-8466-6)

```
se_of_proportion(p = NULL, n = NULL)
```

Arguments

p a vector of proportions; each of the proportion values must be between 0 and 1 n a vector of sample sizes; number of observations used to calculate each of the percentage values

Examples

Description

Conduct a simple effects analysis to probe a two-way interaction effect. See Field et al. (2012, ISBN: 978-1-4462-0045-2).

Usage

```
simple_effects_analysis(
  data = NULL,
  dv_name = NULL,
  iv_1_name = NULL,
  iv_2_name = NULL,
  iv_1_levels = NULL,
  iv_2_levels = NULL,
  print_contrast_table = "weights_sums_and_products",
  output = NULL
)
```

Arguments

```
data
                  a data object (a data frame or a data.table)
dv_name
                  name of the dependent variable (DV)
iv_1_name
                  name of the first independent variable (IV1), whose main effects will be exam-
                  ined in the first set of contrasts
iv_2_name
                  name of the second independent variable (IV2), whose simple effects at each
                  level of IV1 will be examined in the second set of contrasts
iv_1_levels
                  ordered levels of IV1
iv_2_levels
                  ordered levels of IV2
print_contrast_table
                  If print_contrast_table = "weights_sums_and_products", contrasts' weights,
                  sums of the weights and products will be printed. If print_contrast_table =
```

"weights_only", only the contrasts will be printed.

skewness 133

output

output can be one of the following: "lm_object", "table", "weights_only", "weights_sums_and_products", "all" By default, output = NULL, and there will be no output from the function other than the tables of simple effects and constrasts which will be printed on the console by default.

Value

By default, the function will print a table of contrasts and a table of simple effects.

Examples

```
two_way_anova(
  data = mtcars, dv_name = "mpg", iv_1_name = "vs",
  iv_2_name = "am", iterations = 100, plot = TRUE)
simple_effects_analysis(
  data = mtcars, dv_name = "mpg", iv_1_name = "vs",
  iv_2_name = "am")
```

skewness

Skewness

Description

Calculate skewness using one of three formulas: (1) the traditional Fisher-Pearson coefficient of skewness; (2) the adjusted Fisher-Pearson standardized moment coefficient; (3) the Pearson 2 skewness coefficient. Formulas were taken from Doane & Seward (2011), doi:10.1080/10691898.2011.11889611

Usage

```
skewness(vector = NULL, type = "adjusted")
```

Arguments

vector a numeric vector

type a character string indicating the type of skewness to calculate. If type = "adjusted",

the adjusted Fisher-Pearson standardized moment coefficient will be calculated. If type = "traditional", the traditional Fisher-Pearson coefficient of skewness will be calculated. If type = "pearson_2", the Pearson 2 skewness coeffi-

cient will be calculated. By default, type = "adjusted".

Value

a numeric value, i.e., skewness of the given vector

Examples

```
# calculate the adjusted Fisher-Pearson standardized moment coefficient
kim::skewness(c(1, 2, 3, 4, 5, 10))
# calculate the traditional Fisher-Pearson coefficient of skewness
kim::skewness(c(1, 2, 3, 4, 5, 10), type = "traditional")
# compare with skewness from 'moments' package
moments::skewness(c(1, 2, 3, 4, 5, 10))
# calculate the Pearson 2 skewness coefficient
kim::skewness(c(1, 2, 3, 4, 5, 10), type = "pearson_2")
```

spotlight_2_by_continuous

Spotlight 2 by Continuous

Description

Conduct a spotlight analysis for a 2 x Continuous design. See Spiller et al. (2013) doi:10.1509/jmr.12.0420

```
spotlight_2_by_continuous(
  data = NULL,

  caption = NULL,
  plot_margin = ggplot2::unit(c(60, 30, 7, 7), "pt"),
  silent = FALSE
)
```

Arguments

```
data a data object (a data frame or a data.table)

iv_name name of the binary independent variable (IV)
```

dv_name name of the dependent variable (DV)

mod_name name of the continuous moderator variable (MOD)

logistic logical. Should logistic regressions be conducted, rather than ordinary least

squares regressions? By default, ordinary least squares regressions will be con-

ducted.

covariate_name name(s) of the variable(s) to control for in estimating conditional values of the

DV.

focal_values focal values of the moderator variable at which to estimate IV's effect on DV.

interaction_p_include

logical. Should the plot include a p-value for the interaction term?

iv_level_order order of levels in the independent variable for legend. By default, it will be set

as levels of the independent variable ordered using R's base function sort.

output_type type of output (default = "plot"). Other possible values include "spotlight_results",

"dt_for_plotting", "modified_dt"

colors set colors for the two levels of the independent variable By default, colors =

c("red", "blue").

dot_size size of the observed_dots (default = 3)

observed_dots logical. If observed_dots = TRUE, the observed values of all IV, DV, and MOD

combinations will be plotted as dots. On top of these dots the spotlight analysis plot will be laid. If observed_dots = FALSE, these dots will not be plotted. By

default, observed_dots = FALSE.

reg_lines logical. If reg_lines = TRUE, the regression lines from regressing DV on MOD

at each value of IV will be plotted. If reg_lines = FALSE, these regression lines

will not be plotted. By default, observed_dots = FALSE.

reg_line_width thickness of the regression lines (default = 1).

reg_line_size deprecated. Use reg_line_width instead. thickness of the regression lines

(default = 1).

lines_connecting_est_dv

logical. Should lines connecting the estimated values of DV be drawn? (default

= TRUE)

lines_connecting_est_dv_width

thickness of the lines connecting the estimated values of DV (default = 1).

estimated_dv_dot_shape

ggplot value for shape of the dots at estimated values of DV (default = 15, a

square shape).

estimated_dv_dot_size

size of the dots at estimated values of DV (default = 6).

error_bar if error_bar = "se"; error bars will be +/-1 standard error, if error_bar = "ci"

error bars will be a confidence interval. By default, error_bar = "ci".

error_bar_range

width of the confidence interval (default = 0.95 for a 95 percent confidence

interval). This argument will not apply when error_bar = "se"

error_bar_tip_width

graphically, width of the segments at the end of error bars (default = 0.13)

```
error_bar_tip_width_percent
                 (default)
error_bar_thickness
                 thickness of the error bars (default = 1)
error_bar_offset
                 (default)
error_bar_offset_percent
                 (default)
simp_eff_bracket_leg_ht
                 (default)
simp_eff_bracket_leg_ht_perc
                 (default)
simp_eff_bracket_offset
                 (default)
simp_eff_bracket_offset_perc
                 (default)
simp_eff_bracket_color
                 (default)
simp_eff_bracket_line_width
                 (default)
simp_eff_text_offset
                 (default)
simp_eff_text_offset_percent
                 (default)
simp_eff_text_hjust
simp_eff_text_part_1
                 The first part of the text for labeling simple effects. By default, simp_eff_text_part_1
                 = "Simple Effect\n"
simp_eff_text_color
                 color for the text indicating p-values of simple effects (default = "black").
simp_eff_font_size
                 font size of the text indicating p-values of simple effects (default = 5).
interaction_p_value_x
                 (default)
interaction_p_value_y
                 (default)
interaction_p_value_font_size
                 font size for the interaction p value (default = 6)
interaction_p_value_vjust
                 (default)
interaction_p_value_hjust
                 (default)
x_axis_breaks
                 (default)
```

```
x_axis_limits
                  (default)
x_axis_tick_mark_labels
                  (default)
y_axis_breaks
                  (default)
y_axis_limits
                  (default)
x_axis_space_left_perc
                  (default)
x_axis_space_right_perc
                  (default)
y_axis_tick_mark_labels
                  (default)
x_axis_title
                  title of the x axis. By default, it will be set as input for mod_name. If x_axis_title
                  = FALSE, it will be removed.
                  title of the y axis. By default, it will be set as input for dv_name. If y_axis_title
y_axis_title
                  = FALSE, it will be removed.
legend_title
                  title of the legend. By default, it will be set as input for iv_name. If legend_title
                  = FALSE, it will be removed.
legend_position
                  position of the legend (default = "right"). If legend_position = "none", the
                  legend will be removed.
y_axis_title_vjust
                  position of the y axis title (default = 0.85). If default is used, y_axis_title_vjust
                  = 0.85, the y axis title will be positioned at 85% of the way up from the bottom
                  of the plot.
round_decimals_int_p_value
                  To how many digits after the decimal point should the p value for the interaction
                  term be rounded? (default = 3)
jitter_x_percent
                  horizontally jitter dots by a percentage of the range of x values
jitter_y_percent
                  vertically jitter dots by a percentage of the range of y values
dot_alpha
                  opacity of the dots (0 = completely transparent, 1 = completely opaque). By
                  default, dot_alpha = 0.2
reg_line_alpha (default)
jn_point_font_size
                  (default)
reg_line_types types of the regression lines for the two levels of the independent variable. By
                  default, reg_line_types = c("solid", "dashed")
                  (default)
caption
plot_margin
                  margin for the plot By default plot_margin = ggplot2::unit(c(60, 30, 7,
                  7), "pt")
silent
                  If silent = FALSE, (various) messages will be printed. If silent = TRUE, the
                  messages will be suppressed. By default, silent = FALSE.

```

standardize

Standardize

Description

Standardize (i.e., normalize, obtain z-scores, or obtain the standard scores)

Usage

```
standardize(x = NULL)
```

Arguments

Х

a numeric vector

Value

the output will be a vector of the standard scores of the input.

Examples

```
standardize(1:10)
```

standardized_regression

Standardized Regression

Description

This function standardizes all variables for a regression analysis (i.e., dependent variable and all independent variables) and then conducts a regression with the standardized variables.

```
standardized_regression(
  data = NULL,
  formula = NULL,
  reverse_code_vars = NULL,
  sigfigs = NULL,
  round_digits_after_decimal = NULL,
  round_p = 3,
  pretty_round_p_value = TRUE,
```

standardized_regression 141

```
return_table_upper_half = FALSE,
round_r_squared = 3,
round_f_stat = 2,
prettify_reg_table_col_names = TRUE
)
```

Arguments

```
data
                  a data object (a data frame or a data.table)
formula
                  a formula object for the regression equation
reverse_code_vars
                  names of binary variables to reverse code
                  number of significant digits to round to
sigfigs
round_digits_after_decimal
                  round to nth digit after decimal (alternative to sigfigs)
round_p
                  number of decimal places to which to round p-values (default = 3)
pretty_round_p_value
                  logical. Should the p-values be rounded in a pretty format (i.e., lower threshold:
                  "<.001"). By default, pretty_round_p_value = TRUE.
return_table_upper_half
                  logical. Should only the upper part of the table be returned? By default, return_table_upper_half
                  = FALSE.
round_r_squared
                  number of digits after the decimal both r-squared and adjusted r-squared values
                  should be rounded to (default 3)
                  number of digits after the decimal the f statistic of the regression model should
round_f_stat
                  be rounded to (default 2)
prettify_reg_table_col_names
                  logical. Should the column names of the regression table be made pretty (e.g.,
                  change "std_beta" to "Std. Beta")? (Default = TRUE)
```

Value

the output will be a data.table showing multiple regression results.

```
standardized_regression(data = mtcars, formula = mpg ~ gear * cyl)
standardized_regression(
data = mtcars, formula = mpg ~ gear + gear:am + disp * cyl,
round_digits_after_decimal = 3)
```

142 start_kim

start_kim

Start kim

Description

Start kim (update kim; attach default packages; set working directory, etc.) This function requires installing Package 'remotes' v2.4.2 (or possibly a higher version) by Csardi et al. (2021), https://cran.r-project.org/package=remotes

Usage

```
start_kim(
  update = TRUE,
  upgrade_other_pkg = FALSE,
  setup_r_env = TRUE,
  default_packages = c("data.table", "ggplot2"),
  silent_load_pkgs = c("data.table", "ggplot2")
)
```

Arguments

update

If update = "force", force updating the package 'kim'. If update = TRUE, compares the currently installed package 'kim' with the most recent version on GitHub and, if the version on GitHub is more recent, ask the user to confirm the update. If confirmed, then update the package. If update = FALSE, skip updating the package. By default, update = "force"

upgrade_other_pkg

input for the upgrade argument to be passed on to remotes::install_github. One of "default", "ask", "always", "never", TRUE, or FALSE. "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE correspond to "always" and "never" respectively. By default, upgrade_other_pkg = FALSE.

setup_r_env

logical. If update = TRUE, runs the function setup_r_env in the package "kim". Type "?kim::setup_r_env" to learn more. By default, setup_r_env = TRUE

default_packages

a vector of names of packages to load and attach. By default, default_packages = c("data.table", "ggplot2")

silent_load_pkgs

a character vector indicating names of packages to load silently (i.e., suppress messages that get printed when loading the packages). By default, silent_load_pkgs = c("data.table", "ggplot2")

su 143

Examples

```
## Not run:
start_kim()
start_kim(default_packages = c("dplyr", "ggplot2"))
start_kim(update = TRUE, setup_r_env = FALSE)
## End(Not run)
```

su

su: Sorted unique values

Description

Extract unique elements and sort them

Usage

```
su(x = NULL, na.last = TRUE, decreasing = FALSE)
```

Arguments

a vector or a data frame or an array or NULL.

na.last an argument to be passed onto the 'sort' function (in base R) for controlling the treatment of NA values. If na.last = TRUE, NA values in the data are put last; if na.last = FALSE, NA values are put first; if na.last = NA, NA values are removed. By default, na.last = TRUE

decreasing logical. Should the sort be increasing or decreasing? An argument to be passed onto the 'sort' function (in base R). By default, decreasing = FALSE

Value

a vector, data frame, or array-like 'x' but with duplicate elements/rows removed.

```
su(c(10, 3, 7, 10, NA))
su(c("b", "z", "b", "a", NA, NA, NA))
```

144 tabulate_vector

tabulate_vector

Tabulate vector

Description

Shows frequency and proportion of unique values in a table format

Usage

```
tabulate_vector(
  vector = NULL,
  na.rm = TRUE,
  sort_by_decreasing_count = NULL,
  sort_by_increasing_count = NULL,
  sort_by_decreasing_value = NULL,
  sort_by_increasing_value = NULL,
  total_included = TRUE,
  sigfigs = NULL,
  round_digits_after_decimal = NULL,
  output_type = "dt"
)
```

Arguments

```
vector
                  a character or numeric vector
                  if TRUE, NA values will be removed before calculating frequencies and propor-
na.rm
                  tions.
sort_by_decreasing_count
                  if TRUE, the output table will be sorted in the order of decreasing frequency.
sort_by_increasing_count
                  if TRUE, the output table will be sorted in the order of increasing frequency.
sort_by_decreasing_value
                  if TRUE, the output table will be sorted in the order of decreasing value.
sort_by_increasing_value
                  if TRUE, the output table will be sorted in the order of increasing value.
total_included if TRUE, the output table will include a row for total counts.
sigfigs
                  number of significant digits to round to
round_digits_after_decimal
                  round to nth digit after decimal (alternative to sigfigs)
                  if output_type = "df", return a data.frame. By default, output_type = "dt",
output_type
                  which will return a data.table.
```

Value

if output_type = "dt", which is the default, the output will be a data.table showing the count and proportion (percent) of each element in the given vector; if output_type = "df", the output will be a data.frame showing the count and proportion (percent) of each value in the given vector.

tau_squared 145

Examples

```
tabulate_vector(c("a", "b", "b", "c", "c", "c", NA))
tabulate_vector(c("a", "b", "b", "c", "c", "c", NA),
    sort_by_increasing_count = TRUE
)
tabulate_vector(c("a", "b", "b", "c", "c", "c", NA),
    sort_by_decreasing_value = TRUE
)
tabulate_vector(c("a", "b", "b", "c", "c", "c", NA),
    sort_by_increasing_value = TRUE
)
tabulate_vector(c("a", "b", "b", "c", "c", "c", NA),
    sigfigs = 4
)
tabulate_vector(c("a", "b", "b", "c", "c", "c", NA),
    round_digits_after_decimal = 1
)
tabulate_vector(c("a", "b", "b", "c", "c", "c", NA),
    output_type = "df"
)
```

tau_squared

Tau-squared (between-studies variance for meta analysis)

Description

Calculate tau-squared, the between-studies variance (the variance of the effect size parameters across the population of studies), as illustrated in Borenstein et al. (2009, pp. 72-73, ISBN: 978-0-470-05724-7).

Usage

```
tau_squared(effect_sizes = NULL, effect_size_variances = NULL)
```

Arguments

Details

Negative values of tau-squared are converted to 0 in the output (see Cheung, 2013; https://web.archive.org/web/202305122253

146 theme_kim

Examples

```
## Not run:
tau_squared(effect_sizes = c(1, 2), effect_size_variances = c(3, 4))
# a negative tau squared value is converted to 0:
tau_squared(effect_sizes = c(1.1, 1.4), effect_size_variances = c(1, 4))
## End(Not run)
```

theme_kim

Theme Kim

Description

A custom ggplot theme

Usage

```
theme_kim(
  legend_position = "none",
  legend_spacing_y = 1,
  legend_key_size = 3,
  base_size = 20,
  axis_tick_font_size = 20,
  axis_title_font_size = 24,
  y_axis_title_vjust = 0.85,
  axis_title_margin_size = 24,
  cap_axis_lines = FALSE
)
```

Arguments

```
legend_position
                  position of the legend (default = "none")
legend_spacing_y
                   vertical spacing of the legend keys in the unit of "cm" (default = 1)
legend_key_size
                   size of the legend keys in the unit of "lines" (default = 3)
                  base font size
base_size
axis_tick_font_size
                  font size for axis tick marks
axis_title_font_size
                   font size for axis title
y_axis_title_vjust
                  position of the y axis title (default = 0.85). If default is used, y_axis_title_vjust
                  = 0.85, the y axis title will be positioned at 85% of the way up from the bottom
                  of the plot.
```

top_median_or_bottom 147

Details

If a axis lines are to be capped at the ends, the following package(s) must be installed prior to running the function: Package 'lemon' v0.4.4 (or possibly a higher version) by Edwards et al. (2020), https://cran.r-project.org/package=lemon

Value

```
a ggplot object; there will be no meaningful output from this function. Instead, this function should be used with another ggplot object, e.g., ggplot(mtcars, aes(x = disp, y = mpg)) + theme_kim()
```

Examples

```
prep(ggplot2)
ggplot2::ggplot(mtcars, aes(x = cyl, y = mpg)) +
geom_point() + theme_kim()
```

```
top_median_or_bottom Top, median, or bottom
```

Description

Indicates whether each value in a vector belongs to top, median, or bottom

Usage

```
top_median_or_bottom(vector)
```

Arguments

vector

a numeric vector

Value

a character vector indicating whether each element in a vector belongs to "top", "median", or "bottom"

```
top_median_or_bottom(c(1, 2, 3, NA))
top_median_or_bottom(c(1, 2, 2, NA))
top_median_or_bottom(c(1, 1, 2, NA))
```

148 tv

tv Tabulate vector

Description

Shows frequency and proportion of unique values in a table format. This function is a copy of the earlier function, tabulate_vector, in Package 'kim'

Usage

```
tv(
  vector = NULL,
  na.rm = FALSE,
  sort_by_decreasing_count = NULL,
  sort_by_increasing_count = NULL,
  sort_by_decreasing_value = NULL,
  sort_by_increasing_value = NULL,
  total_included = TRUE,
  sigfigs = NULL,
  round_digits_after_decimal = NULL,
  output_type = "dt"
)
```

Arguments

vector a character or numeric vector na.rm if TRUE, NA values will be removed before calculating frequencies and proportions. By default, FALSE. sort_by_decreasing_count if TRUE, the output table will be sorted in the order of decreasing frequency. sort_by_increasing_count if TRUE, the output table will be sorted in the order of increasing frequency. sort_by_decreasing_value if TRUE, the output table will be sorted in the order of decreasing value. sort_by_increasing_value if TRUE, the output table will be sorted in the order of increasing value. total_included if TRUE, the output table will include a row for total counts. sigfigs number of significant digits to round to round_digits_after_decimal round to nth digit after decimal (alternative to sigfigs) if output_type = "df", return a data.frame. By default, output_type = "dt", output_type which will return a data.table.

two_way_anova 149

Value

if output_type = "dt", which is the default, the output will be a data.table showing the count and proportion (percent) of each element in the given vector; if output_type = "df", the output will be a data.frame showing the count and proportion (percent) of each value in the given vector.

Examples

```
tv(c("a", "b", "b", "c", "c", "c", NA))
tv(c("a", "b", "b", "c", "c", "c", NA),
    sort_by_increasing_count = TRUE
)
tv(c("a", "b", "b", "c", "c", "c", NA),
    sort_by_decreasing_value = TRUE
)
tv(c("a", "b", "b", "c", "c", "c", NA),
    sort_by_increasing_value = TRUE
)
tv(c("a", "b", "b", "c", "c", "c", NA),
    sigfigs = 4
)
tv(c("a", "b", "b", "c", "c", "c", NA),
    round_digits_after_decimal = 1
)
tv(c("a", "b", "b", "c", "c", "c", NA),
    output_type = "df"
)
```

two_way_anova

Two-way ANOVA

Description

Conduct a two-way analysis of variance (ANOVA).

Usage

```
two_way_anova(
  data = NULL,
  dv_name = NULL,
  iv_1_name = NULL,
  iv_2_name = NULL,
  iv_1_values = NULL,
  iv_2_values = NULL,
  sigfigs = 3,
  robust = FALSE,
  iterations = 2000,
  plot = TRUE,
  error_bar = "ci",
```

150 two_way_anova

```
error_bar_range = 0.95,
  error_bar_tip_width = 0.13,
  error_bar_thickness = 1,
  error_bar_caption = TRUE,
  line_colors = NULL,
  line_types = NULL,
  line_thickness = 1,
  dot_size = 3,
 position_dodge = 0.13,
  x_axis_title = NULL,
 y_axis_title = NULL,
  y_axis_title_vjust = 0.85,
  legend_title = NULL,
  legend_position = "right",
  output = "anova_table",
  png_name = NULL,
 width = 7000,
 height = 4000,
 units = "px",
  res = 300.
 layout_matrix = NULL
)
```

Arguments

a data object (a data frame or a data.table) data dv name name of the dependent variable iv_1_name name of the first independent variable iv_2_name name of the second independent variable iv_1_values restrict all analyses to observations having these values for the first independent variable iv_2_values restrict all analyses to observations having these values for the second independent variable sigfigs number of significant digits to which to round values in anova table (default = robust if TRUE, conduct a robust ANOVA in addition. number of bootstrap samples for robust ANOVA. The default is set at 2000, but iterations consider increasing the number of samples to 5000, 10000, or an even larger number, if slower handling time is not an issue. plot if TRUE, print a plot and enable returning an output (default = TRUE) if error_bar = "se"; error bars will be +/-1 standard error; if error_bar = error_bar "ci" error bars will be a confidence interval error_bar_range width of the confidence interval (default = 0.95 for 95 percent confidence inter-

val). This argument will not apply when error_bar = "se"

two_way_anova 151

error_bar_tip_width graphically, width of the segments at the end of error bars (default = 0.13) error_bar_thickness thickness of the error bars (default = 1) error_bar_caption should a caption be included to indicate the width of the error bars? (default = TRUE). line colors colors of the lines connecting means (default = NULL) If the second IV has two levels, then by default, line_colors = c("red", "blue") line_types types of the lines connecting means (default = NULL) If the second IV has two levels, then by default, line_types = c("solid", "dashed") line_thickness thickness of the lines connecting group means, (default = 1) dot_size size of the dots indicating group means (default = 3) position_dodge by how much should the group means and error bars be horizontally offset from each other so as not to overlap? (default = 0.13) a character string for the x-axis title. If no input is entered, then, by default, the x_axis_title first value of iv_name will be used as the x-axis title. a character string for the y-axis title. If no input is entered, then, by default, y_axis_title dv_name will be used as the y-axis title. y_axis_title_vjust position of the y axis title (default = 0.85). By default, y_axis_title_vjust = 0.85, which means that the y axis title will be positioned at 85% of the way up from the bottom of the plot. legend_title a character for the legend title. If no input is entered, then, by default, the second value of iv_name will be used as the legend title. If legend_title = FALSE, then the legend title will be removed. legend_position position of the legend: "none", "top", "right", "bottom", "left", "none" (default = "right") output type can be one of the following: "anova_table", "group_stats", output "plot", "robust_anova_results", "robust_anova_post_hoc_results", "robust_anova_post_hoc name of the PNG file to be saved. If png_name = TRUE, the name will be "two_way_anova_" png_name followed by a timestamp of the current time. The timestamp will be in the format, jan_01_2021_1300_10_000001, where "jan_01_2021" would indicate January 01, 2021; 1300 would indicate 13:00 (i.e., 1 PM); and 10_000001 would indicate 10.000001 seconds after the hour. width width of the PNG file (default = 7000) height height of the PNG file (default = 4000) the units for the width and height arguments. Can be "px" (pixels), "in" units (inches), "cm", or "mm". By default, units = "px". The nominal resolution in ppi which will be recorded in the png file, if a positive res integer. Used for units other than the default. If not specified, taken as 300 ppi to set the size of text and line widths. The layout argument for arranging plots and tables using the grid.arrange layout_matrix

function.

t_test_pairwise

Details

The following package(s) must be installed prior to running this function: Package 'car' v3.0.9 (or possibly a higher version) by Fox et al. (2020), https://cran.r-project.org/package=car If robust ANOVA is to be conducted, the following package(s) must be installed prior to running the function: Package 'WRS2' v1.1-1 (or possibly a higher version) by Mair & Wilcox (2021), https://cran.r-project.org/package=WRS2

Value

by default, the output will be "anova_table"

Examples

```
two_way_anova(
  data = mtcars, dv_name = "mpg", iv_1_name = "vs",
  iv_2_name = "am", iterations = 100)
anova_results <- two_way_anova(
  data = mtcars, dv_name = "mpg", iv_1_name = "vs",
  iv_2_name = "am", output = "all")
anova_results</pre>
```

t_test_pairwise

t-tests, pairwise

Description

Conducts a t-test for every possible pairwise comparison with Holm or Bonferroni correction

Usage

```
t_test_pairwise(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  sigfigs = 3,
  cohen_d = TRUE,
  cohen_d_w_ci = TRUE,
  adjust_p = "holm",
  bonferroni = NULL,
  mann_whitney = TRUE,
  t_test_stats = FALSE,
  t_test_df_decimals = 1,
  sd = FALSE,
  round_p = 3,
  anova = TRUE,
  round_f = 2
)
```

t_test_pairwise 153

Arguments

data	a data object (a data frame or a data.table)			
iv_name	name of the independent variable			
dv_name	name of the dependent variable			
sigfigs	number of significant digits to round to			
cohen_d	if cohen_d = TRUE, Cohen's d statistics will be included in the output data.table.			
cohen_d_w_ci	if cohen_d_w_ci = TRUE, Cohen's d with 95% CI will be included in the output data.table.			
adjust_p	the name of the method to use to adjust p-values. If $adjust_p = "holm"$, the Holm method will be used; if $adjust_p = "bonferroni"$, the Bonferroni method will be used. By default, $adjust_p = "holm"$			
bonferroni	The use of this argument is deprecated. Use the 'adjust_p' argument instead. If bonferroni = TRUE, Bonferroni tests will be conducted for t-tests or Mann-Whitney tests.			
mann_whitney	if TRUE, Mann-Whitney test results will be included in the output data.table. If FALSE, Mann-Whitney tests will not be performed.			
t_test_stats	if t_test_stats = TRUE, t-test statistic and degrees of freedom will be included in the output data.table.			
t_test_df_decimals				
	number of decimals for the degrees of freedom in t-tests (default = 1)			
sd	if sd = TRUE, standard deviations will be included in the output data.table.			
round_p	number of decimal places to which to round p-values (default = 3)			
anova	Should a one-way ANOVA be conducted and reported? (default = TRUE)			
round_f	number of decimal places to which to round the f statistic (default = 2)			

Value

the output will be a data.table showing results of all pairwise comparisons between levels of the independent variable.

```
## Not run:
t_test_pairwise(data = iris, iv_name = "Species", dv_name = "Sepal.Length")
t_test_pairwise(data = iris, iv_name = "Species",
dv_name = "Sepal.Length", t_test_stats = TRUE, sd = TRUE)
t_test_pairwise(data = iris, iv_name = "Species", dv_name = "Sepal.Length",
mann_whitney = FALSE)
## End(Not run)
```

und

Undocumented functions

Description

A collection of miscellaneous functions lacking documentations

Usage

```
und(fn, ...)
```

Arguments

```
fn name of the function
... arguments for the function
```

Value

the output will vary by function

Examples

```
# correlation
und(corr_text, x = 1:5, y = c(1, 2, 2, 2, 3))
# mean center
und(mean_center, 1:10)
# compare results with base function
scale(1:10, scale = TRUE)
# find the modes
und(mode, c(3, 3, 3, 1, 2, 2))
# return values that are not outliers
und(outlier_rm, c(12:18, 100))
kim::outlier(c(1:10, 100))
```

```
unload_user_installed_pkgs
```

Unload all user-installed packages

Description

Unload all user-installed packages

Usage

```
unload_user_installed_pkgs(exceptions = NULL, force = FALSE, keep_kim = TRUE)
```

update_kim 155

Arguments

exceptions a character vector of names of packages to keep loaded

force logical. Should a package be unloaded even though other attached packages

depend on it? By default, force = FALSE

keep_kim logical. If keep_kim = FALSE, Package 'kim' will be detached along with all

other user-installed packages. If keep_kim = TRUE, Package 'kim' will not be

detached. By default, keep_kim = FALSE

Examples

```
## Not run:
unload_user_installed_pkgs()
## End(Not run)
```

update_kim

Update the package 'kim'

Description

Updates the current package 'kim' by installing the most recent version of the package from GitHub This function requires installing Package 'remotes' v2.4.2 (or possibly a higher version) by Csardi et al. (2021), https://cran.r-project.org/package=remotes

Usage

```
update_kim(force = TRUE, upgrade_other_pkg = FALSE, confirm = TRUE)
```

Arguments

force

confirm

logical. If force = TRUE, force installing the update. If force = FALSE, do not force installing the update. By default, force = TRUE.

upgrade_other_pkg

input for the upgrade argument to be passed on to remotes::install_github. One of "default", "ask", "always", "never", TRUE, or FALSE. "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE correspond to "always" and "never" respectively. By default, upgrade_other_pkg = FALSE.

-1-0.

logical. If confirm = TRUE, the user will need to confirm the update. If confirm = FALSE, the confirmation step will be skipped. By default, confirm = TRUE.

Value

there will be no output from this function. Rather, executing this function will update the current 'kim' package by installing the most recent version of the package from GitHub.

var_of_percentage

Examples

```
## Not run:
if (interactive()) {update_kim()}
## End(Not run)
```

```
var_of_log_odds_ratio_to_var_of_d
```

Convert variance of log odds ratio to variance of d

Description

Convert the variance of a log odds ratio to the variance of a Cohen'd (standardized mean difference), as illustrated in Borenstein et al. (2009, p. 47, ISBN: 978-0-470-05724-7)

Usage

```
var_of_log_odds_ratio_to_var_of_d(var_of_log_odds_ratio = NULL)
```

Arguments

```
var_of_log_odds_ratio
the variance of a log odds ratio (the input can be a vector of values)
```

Examples

```
## Not run:
var_of_log_odds_ratio_to_var_of_d(1)
## End(Not run)
```

var_of_percentage

Variance of a percentage

Description

Calculate the variance of a percentage. See Fowler, Jr. (2014, p. 34, ISBN: 978-1-4833-1240-8)

Usage

```
var_of_percentage(percent = NULL, n = NULL)
```

var_of_proportion 157

Arguments

percent a vector of percentages; each of the percentage values must be between 0 and

100

n a vector of sample sizes; number of observations used to calculate each of the

percentage values

Examples

```
var_of_percentage(percent = 40, n = 50)
var_of_percentage(percent = 50, n = 10)
```

var_of_proportion

Variance of a proportion

Description

Calculate the variance of a proportion. See Anderson and Finn (1996, p. 364, ISBN: 978-1-4612-8466-6)

Usage

```
var_of_proportion(p = NULL, n = NULL)
```

Arguments

p a vector of proportions; each of the proportion values must be between 0 and 1

n a vector of sample sizes; number of observations used to calculate each of the

percentage values

```
var_of_proportion(p = 0.56, n = 400)
var_of_proportion(p = 0.5, n = 100)
var_of_proportion(p = 0.4, n = 50)
var_of_proportion(p = c(0.5, 0.9), n = c(100, 200))
```

vlookup

Vlookup

Description

Look up values in a reference data.table and return values associated with the looked-up values contained in the reference data.table

Usage

```
vlookup(
  lookup_values = NULL,
  reference_dt = NULL,
  col_name_for_lookup_values = NULL,
  col_name_for_output_values = NULL)
```

Arguments

```
lookup_values a vector of values to look up

reference_dt a data.table containing the values to look up as well as values associated with the looked-up values that need to be returned.

col_name_for_lookup_values in the reference data.table, name of the column containing lookup_values.

col_name_for_output_values in the reference data.table, name of the column containing values to return (i.e., values associated with the looked-up values that will be the function's output)
```

Examples

```
vlookup(lookup_values = c(2.620, 2.875), reference_dt = mtcars[1:9, ],
col_name_for_lookup_values = "wt", col_name_for_output_values = "qsec")
```

```
weighted_mean_effect_size
```

Estimate the mean effect size in a meta analysis

Description

Estimate the mean effect size in a meta analysis, as illustrated in Borenstein et al. (2009, pp. 73-74, ISBN: 978-0-470-05724-7)

weighted_mean_r 159

Usage

```
weighted_mean_effect_size(
  effect_sizes = NULL,
  effect_size_variances = NULL,
  ci = 0.95,
  one_tailed = FALSE,
  random_vs_fixed = "random"
)
```

Arguments

Examples

```
## Not run:
weighted_mean_effect_size(
effect_sizes = c(1, 2), effect_size_variances = c(3, 4))
weighted_mean_effect_size(
effect_sizes = c(0.095, 0.277, 0.367, 0.664, 0.462, 0.185),
effect_size_variances = c(0.033, 0.031, 0.050, 0.011, 0.043, 0.023))
# if effect sizes have a variance of 0, they will be excluded from
# the analysis
weighted_mean_effect_size(
effect_sizes = c(1.1, 1.2, 1.3, 1.4),
effect_size_variances = c(1, 0, 0, 4))
## End(Not run)
```

weighted_mean_r

Weighted mean correlation

Description

Calculate the weighted mean correlation coefficient for a given correlations and sample sizes. This function uses the Hedges-Olkin Method with random effects. See Field (2001) doi:10.1037/1082-989X.6.2.161

160 weighted_z

Usage

```
weighted_mean_r(r = NULL, n = NULL, ci = 0.95, sigfigs = 3, silent = FALSE)
```

Arguments

r	a (vector of) correlation coefficient(s)
n	a (vector of) sample size(s)
ci	width of the confidence interval. Input can be any value less than 1 and greater than or equal to 0. By default, $ci = 0.95$. If $ci = TRUE$, the default value of 0.95 will be used. If $ci = FALSE$, no confidence interval will be estimated.
sigfigs	number of significant digits to round to (default = 3)
silent	logical. If silent = FALSE, a message regarding the weighted mean correlation and its p-value and CI will be printed. If silent = TRUE, this message will be

suppressed. By default, silent = FALSE.

Value

the output will be a list of vector of correlation coefficient(s).

Examples

```
weighted_mean_r(r = c(0.2, 0.4), n = c(100, 100)) weighted_mean_r(r = c(0.2, 0.4), n = c(100, 20000)) # example consistent with using MedCalc weighted_mean_r(r = c(0.51, 0.48, 0.3, 0.21, 0.6, 0.46, 0.22, 0.25), n = c(131, 129, 155, 121, 111, 119, 112, 145))
```

weighted_z

Weighted z

Description

Calculate the weighted z (for calculating weighted mean correlation). See p. 231 of the book Hedges & Olkin (1985), Statistical Methods for Meta-Analysis (ISBN: 0123363802).

Usage

```
weighted_z(z = NULL, n = NULL)
```

Arguments

z a vector of z values

n a vector of sample sizes which will be used to calculate the weights, which in turn will be used to calculate the weighted z.

161

Value

the output will be a weighted z value.

Examples

```
weighted_z(1:3, c(100, 200, 300)) weighted_z(z = c(1:3, NA), n = c(100, 200, 300, NA))
```

wilcoxon_rank_sum_test

Wilcoxon Rank-Sum Test (Also called the Mann-Whitney U Test)

Description

A nonparametric equivalent of the independent t-test

Usage

```
wilcoxon_rank_sum_test(
  data = NULL,
  iv_name = NULL,
  dv_name = NULL,
  sigfigs = 3
)
```

Arguments

data a data object (a data frame or a data.table)

iv_name name of the independent variable (grouping variable)

dv_name name of the dependent variable (measure variable of interest)

sigfigs number of significant digits to round to

Value

the output will be a data.table object with all pairwise Wilcoxon rank-sum test results

```
wilcoxon_rank_sum_test(
data = iris, iv_name = "Species", dv_name = "Sepal.Length")
```

162 z_score

write_csv

Write to a csv file

Description

Write to a csv file

Usage

```
write_csv(data = NULL, name = NULL, timestamp = NULL)
```

Arguments

data a data object (a data frame or a data.table)

name a character string of the csv file name without the ".csv" extension. For example,

if the csv file to write to is "myfile.csv", enter name = "myfile"

timestamp logical. Should the timestamp be appended to the file name?

Value

the output will be a .csv file in the working directory, that is, an output from the data.table function, fwrite

Examples

```
## Not run:
write_csv(mtcars, "mtcars_from_write_csv")
write_csv(mtcars)
## End(Not run)
```

z_score

 $z\ score$

Description

Calculate z-scores (i.e., standardize or obtain the standard scores)

Usage

```
z_score(x = NULL, na.rm = TRUE)
```

Arguments

x a numeric vector

na.rm logical. If na.rm = TRUE, NA values in the vector will be removed before calcu-

lating z-scores (default = TRUE).

z_to_r_transform 163

Value

the output will be a vector of z-scores.

Examples

```
z_score(1:10)
```

z_to_r_transform

Z to r transformation (Inverse of Fisher's Z transformation)

Description

Perform the Z-to-r transformation (i.e., the inverse of Fisher's r-to-Z transformation) for given Z value(s).

Usage

```
z_{to} = NULL
```

Arguments

Z

a (vector of) Z values

Value

the output will be a vector of correlation coefficient(s) that are the result(s) of the Z-to-r transformation.

```
z_{to_r_transform(2.646652)}
z_{to_r_transform(z = -3:3)}
```
